## Radiochemistry Case Narrative

### Gamma Spectroscopy

#### Cordilleran Compliance Services, Inc.

Rulison Area Well Monitoring  
Paragon Work Order 0811110

1. This report consists of analytical results and supporting documentation for two water samples received by Paragon Analytics on 11/14/08.
2. These samples were prepared according to procedure PA SOP739R9. The samples were aliquoted from the aqueous phase.
3. The samples were analyzed for the presence of gamma emitting radionuclides according to procedure PA SOP713R10. The analyses were completed on 11/29/08.
4. The analysis results for these samples are reported in units of pCi/L. The samples were filtered prior to analysis. Sample 0811110-2 was diluted prior to analysis.
5. Sample volumes were insufficient to allow preparation of a duplicate. A duplicate analysis of sample 0811110-1 was performed in lieu of a prepared duplicate.
6. Activity concentrations above the calculated MDC are reported in some instances where minimum nuclide identification criteria are not met. Such tentative identifications result when the software attempts to calculate net activity concentrations for analytes where either one or both of the following criteria are not satisfied: the ‘diagnostic’ peak for a nuclide must be identified above the critical level, or the minimum library peak abundance must be attained. Nuclides not meeting these requirements have been flagged with a “TI” qualifier.
7. Paragon Analytics has found there to be a significant low bias to  $^{214}\text{Pb}$  and  $^{214}\text{Bi}$  results when using a mixed nuclide gamma source for efficiency calibrations. The magnitude of this bias has been determined to be approximately 32% for  $^{214}\text{Bi}$ , and 23% for  $^{214}\text{Pb}$ . Therefore, any reported results for  $^{214}\text{Pb}$  and  $^{214}\text{Bi}$  are flagged with a “J” qualifier, indicating the activity values to be an estimated value. Results are reported without further qualification.
8. Technical considerations made in the creation of the gamma spectroscopy library used in this analysis are detailed in the document “Technical Comments Regarding Gamma Spectroscopy Libraries” found in Section 5.

9. There are cases where the magnitude of negative activity is greater than the  $2\sigma$  TPU. Under typical conditions, where background data is normally distributed and analyzed by paired observations, this event is likely to occur at least 2.5% of the time. Review of the data does not indicate a problem with the instrument or reporting systems and results are reported without further qualification.
10. No further problems were encountered with either the client samples or the associated quality control samples. All remaining quality control criteria were met.

The data contained in the following report have been reviewed and approved by the personnel listed below. In addition, Paragon Analytics certifies that the analyses reported herein are true, complete and correct within the limits of the methods employed.

#### Comments:

##### Qualifiers/Flags:

- U - Result is less than the sample specific MDC or less than the associated TPU
- Y1 - Chemical Yield is in control at 100-110%. Quantitative Yield is assumed.
- Y2 - Chemical Yield outside default limits.
- LT - Result is less than Requested MDC, greater than sample specific MDC.
- SQ - Spectral quality prevents accurate quantitation.
- SI - Nuclide identification and/or quantitation is tentative.
- TI - Nuclide identification is tentative.
- R - Nuclide has exceeded 8 halflives.
- M - Requested MDC not met.
- B - Analyte concentration greater than MDC.
- B3 - Analyte concentration greater than MDC but less than Requested MDC.

##### Abbreviations:

- TPU - Total Propagated Uncertainty (see PAI SOP 743)
- MDC - Minimum Detectable Concentration (see PAI SOP 709)
- BDL - Below Detection Limit

**Comments:** This sample was filtered prior to analysis.

**Duplicate Qualifiers/Flags:**

U - Result is less than the sample specific MDC.

Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.

Y2 - Chemical Yield outside default limits.

W - DER is greater than Warning Limit of 1.42

D - DER is greater than Control Limit of 2.13

LT - Result is less than Request MDC, greater than sample specific MDC

M - Requested MDC not met.

M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

L - LCS Recovery below lower control limit.

H - LCS Recovery above upper control limit.

P - LCS, Matrix Spike Recovery within control limits.

N - Matrix Spike Recovery outside control limits

**Abbreviations:**

TPU - Total Propagated Uncertainty (see PAI SOP 743)

DER - Duplicate Error Ratio (see PAI SOP 715)

BDL - Below Detection Limit

NR - Not Reported

SQ - Spectral quality prevents accurate quantitation.

SI - Nuclide identification and/or quantitation is tentative.

TI - Nuclide identification is tentative.

R - Nuclide has exceeded 8 halflives.

G - Sample density differs by more than 15% of LCS density.

13967-76-5	Nb-95	2.4 +/- 5.7	9.7		U

**Comments:** This sample was filtered prior to analysis.

**Qualifiers/Flags:**

U - Result is less than the sample specific MDC or less than the associated TPU.

Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.

Y2 - Chemical Yield outside default limits.

LT - Result is less than Requested MDC, greater than sample specific MDC.

M - The requested MDC was not met.

M3 - The requested MDC was not met, but thereported activity is greater than the reported MDC.

W - DER is greater than Warning Limit of 1.42

D - DER is greater than Control Limit of 2.13

SQ - Spectral quality prevents accurate quantitation.

SI - Nuclide identification and/or quantitation is tentative.

TI - Nuclide identification is tentative.

R - Nuclide has exceeded 8 halflives.

G - Sample density differs by more than 15% of LCS density.

**Abbreviations:**

TPU - Total Propagated Uncertainty (see PAI SOP 743)

MDC - Minimum Detectable Concentration (see PAI SOP 709)

BDL - Below Detection Limit

**Data Package ID:** GSW0811110-1

## Technical Comments Regarding Analysis using the FANP Gamma Spectroscopy Library

Analysis using the FANP (Fission, Activation, and Natural Products) library is limited to the list of gamma emitting radionuclides specified by Paragon Analytics. Paragon Analytics specifies all values assigned to the nuclides in this library. In cases where multiple gamma emissions are used to quantify activity, the most abundant emission is used for quantification in the absence of any supporting gamma emissions. It should be noted that the current software program used for gamma spectroscopic analysis is limited to a +/- 2.0 keV photo-peak resolution tolerance. Thus, any gamma emissions occurring within the same +/- 2.0 keV range will suffer interference, consequently preventing accurate quantification. Nuclide specific information regarding analysis using the FANP library is as follows:

Nuclide:  $^{228}\text{Ac}$  Energy: various Photon Abundance: various

All activity values for  $^{228}\text{Ac}$  are calculated using the half-life,  $t_{1/2}=5.75$  years, of the long-lived  $^{228}\text{Ra}$  parent. It is assumed that secular equilibrium is achieved between the  $^{228}\text{Ra}$  parent and the  $^{228}\text{Ac}$  progeny.

Nuclide:  $^{212}\text{Bi}$ ,  $^{212}\text{Pb}$ ,  $^{208}\text{Tl}$  Energy: various Photon Abundance: various

All activity values for  $^{212}\text{Bi}$ ,  $^{212}\text{Pb}$ , and  $^{208}\text{Tl}$  are calculated using the half-life,  $t_{1/2}=1.91$  years, of the long-lived  $^{228}\text{Th}$  parent. It is assumed that secular equilibrium is achieved between the  $^{228}\text{Th}$  parent and the  $^{212}\text{Bi}$ ,  $^{212}\text{Pb}$ ,  $^{208}\text{Tl}$  progeny.

Nuclide:  $^{214}\text{Bi}$ ,  $^{214}\text{Pb}$  Energy: various Photon Abundance: various

All activity values for  $^{214}\text{Bi}$  and  $^{214}\text{Pb}$  are calculated using the half-life,  $t_{1/2}=1600$  years, of the long-lived  $^{226}\text{Ra}$  parent. It is assumed that secular equilibrium is achieved between the  $^{226}\text{Ra}$  parent and the  $^{214}\text{Bi}$  and  $^{214}\text{Pb}$  progeny.

Nuclide:  $^{56}\text{Co}$  Energy: 1175.13 keV Photon Abundance: 0.0228

This emission for this nuclide suffers from possible resolution interference due to the  $^{60}\text{Co}$  gamma emission occurring at 1173.23 keV (0.9997, abundance). Therefore, this emission will be used as an identifier only and not in the activity calculations for this nuclide.

Nuclides:  $^{57}\text{Co}$  Energy: 122.07 Photon Abundance: 0.8560

The most abundant gamma emission specified for quantification of this nuclide suffers from possible resolution interference due to the  $^{152}\text{Eu}$  gamma emission occurring at 121.78 keV (0.2050, abundance). Therefore, a possibility of a high bias to the  $^{57}\text{Co}$  results may occur in the presence of elevated  $^{152}\text{Eu}$  activity.

Nuclide:  $^{134}\text{Cs}$

Energy: 604.66

Photon Abundance: 0.9762

Cesium-134 suffers from coincidence summing, due to the multiple simultaneous photon emissions during each decay event. This results in a potentially low bias in the final analytical results. The magnitude of this low bias is highly dependent on the Cs-134 activity levels and the specific counting geometry. Any Cs-134 activity reported above the associated Minimum Detectable Concentration should be considered to have a potential low bias.

The most abundant gamma emission specified for quantification of this nuclide suffers from possible resolution interference due to the  $^{124}\text{Sb}$  gamma emission occurring at 602.71 keV (0.9826, abundance). Therefore, a possibility of a high bias to the  $^{134}\text{Cs}$  results may occur in the presence of elevated  $^{124}\text{Sb}$  activity.

Other gamma emissions used for quantification of this nuclide suffer from possible resolution interference due to multiple gamma emissions of  $^{228}\text{Ac}$ . Therefore, a possible high bias to the  $^{134}\text{Cs}$  activity results may occur in the presence of elevated  $^{228}\text{Ac}$  activity.

Nuclide:  $^{137}\text{Cs}$

Energy: 661.62 keV

Photon Abundance: 0.8512

Cesium-137 does not emit any gamma photons useful for quantification. However, it can be assumed to be in secular equilibrium with the short-lived  $^{137\text{m}}\text{Ba}$  daughter product. Therefore, the activity for  $^{137}\text{Cs}$  is determined from the 661.62 keV gamma emission of the  $^{137\text{m}}\text{Ba}$  daughter product. The calculated gamma photon abundance used in the library is the product of the 0.8998 abundance of the 661.62 keV  $^{137\text{m}}\text{Ba}$  photon and the 0.946 branching ratio between  $^{137}\text{Ba}$  and  $^{137\text{m}}\text{Ba}$ .

Nuclide:  $^{155}\text{Eu}$

Energy: 105.31

Photon Abundance: 0.2120

The only gamma emission useful for quantification of this nuclide suffers from possible resolution interference due to the  $^{235}\text{U}$  gamma emission occurring at 105 keV (0.0210, abundance). Therefore, a possibility of a high bias to the  $^{155}\text{Eu}$  results may occur in the presence of elevated  $^{235}\text{U}$  activity.

Nuclide:  $^{40}\text{K}$

Energy: 1460.75

Photon Abundance: 0.1100

The only gamma emission useful for quantification of this nuclide suffers from possible resolution interference due to the  $^{228}\text{Ac}$  gamma emission occurring at 1459.2 keV (0.0104, abundance). Therefore, a possibility of a high bias to the  $^{40}\text{K}$  results may occur in the presence of elevated  $^{228}\text{Ac}$  activity.

Nuclide:  $^{54}\text{Mn}$

Energy: 834.81

Photon Abundance: 0.9997

The only gamma emission useful for quantification of this nuclide suffers from possible resolution interference due to the  $^{228}\text{Ac}$  gamma emission occurring at 835.6 keV (0.0182, abundance). Therefore, a possibility of a high bias to the  $^{54}\text{Mn}$  results may occur in the presence of elevated  $^{228}\text{Ac}$  activity.

Nuclide:  $^{95}\text{Nb}$

Energy: 765.82

Photon Abundance: 0.9999

All activity values for  $^{95}\text{Nb}$  are calculated using the half-life,  $t_{1/2}=64.02$  days, of the  $^{95}\text{Zr}$  parent. It is assumed that a transient equilibrium is achieved between the  $^{95}\text{Zr}$  parent and the  $^{95}\text{Nb}$  progeny.

The only gamma emission useful for quantification of this nuclide suffers from possible resolution interference due to the  $^{234\text{m}}\text{Pa}$  gamma emission occurring at 766.6 keV (0.0020, abundance). Therefore, a possibility of a high bias to the  $^{95}\text{Nb}$  results may occur in the presence of elevated  $^{234\text{m}}\text{Pa}$  activity.

Nuclide:  $^{234\text{m}}\text{Pa}$

Energy: 1001.03

Photon Abundance: 0.0059

All activity values for  $^{234\text{m}}\text{Pa}$  are calculated using the half-life,  $t_{1/2}=4.468\text{E+09}$  yrs, of the long-lived  $^{238}\text{U}$  parent. It is assumed that secular equilibrium is achieved between the  $^{238}\text{U}$  parent and the  $^{234\text{m}}\text{Pa}$  progeny.

Nuclide:  $^{106}\text{Ru}$

Energy: various

Photon Abundance: various

Ru-106 does not emit any gamma photons. Therefore, all activity values for  $^{106}\text{Ru}$  are calculated using the gamma emissions of the short-lived  $^{106}\text{Rh}$  daughter. The half-life,  $t_{1/2}=368.2$  days, of the  $^{106}\text{Ru}$  parent is used in the activity calculations. It is assumed that a secular equilibrium is achieved between the  $^{106}\text{Ru}$  parent and the  $^{106}\text{Rh}$  progeny.

Nuclide:  $^{124}\text{Sb}$

Energy: 602.71

Photon Abundance: 0.9826

The most abundant gamma emission specified for quantification of this nuclide suffers from possible resolution interference due to the  $^{134}\text{Cs}$  gamma emission occurring at 604.66 keV (0.9762, abundance). Therefore, a possibility of a high bias to the  $^{124}\text{Sb}$  results may occur in the presence of elevated  $^{134}\text{Cs}$  activity.

Nuclide:  $^{125}\text{Sb}$

Energy: 600.77

Photon Abundance: 0.1786

The gamma emission specified for quantification of this nuclide that occurs at 600.77 keV suffers from possible resolution interference due to the  $^{124}\text{Sb}$  gamma emission occurring at 602.71 keV (0.9826, abundance). Therefore, this photo-peak will be used as an identifier only and not in the activity calculations for this nuclide.

Nuclide:  $^{227}\text{Th}$

Energy: 236.00

Photon Abundance: 0.1230

All activity values for  $^{227}\text{Th}$  are calculated using the half-life,  $t_{1/2}=21.7$  yrs, of the long-lived  $^{227}\text{Ac}$  parent. It is assumed that secular equilibrium is achieved between the  $^{227}\text{Ac}$  parent and the  $^{227}\text{Th}$  progeny.

Nuclide:  $^{234}\text{Th}$

Energy: 92.50

Photon Abundance: 0.0553

The 92.50 keV photo-peak used in this library for Th-234 quantification is actually two separate photo-peaks, occurring at 92.4 keV and 92.8 keV. The current software used for gamma spectroscopic analysis cannot resolve two photo-peaks that occur within the 2-keV resolution tolerance. Therefore, these two photopeaks are observed as a single photo-peak. Therefore, the average of the two photo-peak energies is used in this library. Also, the sum of the two photo-peak abundances, 0.0553, is used in the activity calculations for this observed 'single' photo-peak.

All activity values for  $^{234}\text{Th}$  are calculated using the half-life,  $t_{1/2}=4.468\text{E}+09$  yrs, of the long-lived  $^{238}\text{U}$  parent. It is assumed that secular equilibrium is achieved between the  $^{238}\text{U}$  parent and the  $^{234}\text{Th}$  progeny.

Nuclide:  $^{235}\text{U}$

Energy: 185.70

Photon Abundance: 0.5720

Quantifying  $^{235}\text{U}$  activity using the 185.70 keV photo-peak is vulnerable to a significant high bias due to interference from gamma emissions from  $^{226}\text{Ra}$  occurring at 186.21 keV (0.0328, abundance). Therefore, this emission will be used as an identifier only and not in the activity calculations for this nuclide.

## CERTIFICATE OF CALIBRATION Standard Radionuclide Source

73487-307

RSO# 824 Rec'd 8/25/06  
SUS

1.0 Solid in 138G GA-MA Beaker

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solution sources. The Am-241 was calibrated by 4 pi alpha liquid scintillation counting. All other radionuclides were calibrated using a germanium gamma spectrometer system. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Rev. 1, February, 1979.

## CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

76484A-307  
Sand in 16 Ounce PP MRP Jar

**Customer:** Paragon Analytics / Fort Collins, CO

**P.O. No.:** 72905 REL 12-13-07, Item 3

**Calibration Date:** 01-Jan-2008 12:00 EST **Grams of Master Source:** 0.011313

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solutions. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Revision 1, February, 1979, and compliance with ANSI N42.22-1995, "Traceability of Radioactive Sources to NIST."

\* Master Source refers to Analytics' 8-isotope mixture which is calibrated quarterly.

**Calibration Methods:** 4π LS - 4 pi Liquid Scintillation Counting, HPGe - High Purity Germanium Gamma-Ray Spectrometer, IC - Ionization Chamber. **Uncertainty:** U - Relative expanded uncertainty, k = 2. See NIST Technical Note 1297, "Guidelines for Evaluating and Expressing the Uncertainty of NIST Measurement Results."

**Comments:**

500 grams / 290 mL of customer supplied sand.

This standard will expire one year after the calibration date.

## CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

76484A-307

Sand in 16 Ounce PP MRP Jar

Customer: Paragon Analytics / Fort Collins, CO

P.O. No.: 72905 REL 12-13-07, Item 3

Calibration Date: 01-Jan-2008 12:00 EST Grams of Master Source: 0.011313

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solutions. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Revision 1, February, 1979, and compliance with ANSI N42.22-1995, "Traceability of Radioactive Sources to NIST."

## CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

75354-307

1.0 Liter Solid in 138G GA-MA Beaker

**Customer:** Paragon Analytics

**P.O. No.:** 72905, Item 1

**Calibration Date:** 01-Jul-2007      12:00 EST      **Grams of Master Source:** 0.011424

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solutions. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Revision 1, February, 1979, and compliance with ANSI N42.22-1995, "Traceability of Radioactive Sources to NIST." Density of solid matrix 1.15 g/cc.

\* Master Source refers to Analytics' 8-isotope mixture which is calibrated quarterly.

Calibration Methods: 4π LS - 4 pi Liquid Scintillation Counting, HPGe - High Purity Germanium Gamma-Ray Spectrometer, IC - Ionization Chamber. Uncertainty: U - Relative expanded uncertainty, k = 2. See NIST Technical Note 1297, "Guidelines for Evaluating and Expressing the Uncertainty of NIST Measurement Results."

This standard will expire one year after the calibration date.

## CERTIFICATE OF CALIBRATION Standard Radionuclide Source

73487-307

RSO# 824 Rec'd 8/29/06  
SUS

1.0 Solid in 138G GA-MA Beaker

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solution sources. The Am-241 was calibrated by 4 pi alpha liquid scintillation counting. All other radionuclides were calibrated using a germanium gamma spectrometer system. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Rev. 1, February, 1979.

US Patent 4,430,258; UK Patent GB2,149,194B; CA Patent 1,196,776.  
Density of solid matrix 1.15 g/cc.

Calibration date: July 1, 2006 12:00 EST

## CERTIFICATE OF CALIBRATION

### Standard Radionuclide Source

77649A-307  
1.0 Liter Solid in 138G GA-MA Beaker

**Customer:** Paragon Analytics

**P.O. No.:** 73625, 5/19/08 Rel., Item 1

**Calibration Date:** 01-Jul-2008 12:00 EST **Grams of Master Source:** 0.011238

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solutions. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Revision 1, February, 1979, and compliance with ANSI N42.22-1995, "Traceability of Radioactive Sources to NIST." Density of solid matrix 1.15 g/cc.

Nuclide	Gamma-Ray Energy (keV)	Half-Life, Days	Master Source* cps/gram	This Source cps	Uncertainty, %			Calibration Method

Y-88	1836.1	106.6	4.398E+05	4.942E+03	0.7	1.1	2.6	HPGe

\* Master Source refers to Analytics' 8-isotope mixture which is calibrated quarterly.

**Calibration Methods:** 4π LS - 4 pi Liquid Scintillation Counting, HPGe - High Purity Germanium Gamma-Ray Spectrometer, IC - Ionization Chamber. **Uncertainty:** U - Relative expanded uncertainty, k = 2. See NIST Technical Note 1297, "Guidelines for Evaluating and Expressing the Uncertainty of NIST Measurement Results."

This standard will expire one year after the calibration date.

## CERTIFICATE OF CALIBRATION Standard Radionuclide Source

73487-307

RSO# 824 Rec'd 8/29/06  
GUS

1.0 Solid in 138G GA-MA Beaker

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solution sources. The Am-241 was calibrated by 4 pi alpha liquid scintillation counting. All other radionuclides were calibrated using a germanium gamma spectrometer system. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Rev. 1, February, 1979.

## **CERTIFICATE OF CALIBRATION**

### Standard Radionuclide Source

**77649A-307**

**1.0 Liter Solid in 138G GA-MA Beaker**

**Customer:** Paragon Analytics

**P.O. No.:** 73625, 5/19/08 Rel., Item 1

**Calibration Date:** 01-Jul-2008    12:00 EST    **Grams of Master Source:** 0.011238

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solutions. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Revision 1, February, 1979, and compliance with ANSI N42.22-1995, "Traceability of Radioactive Sources to NIST." Density of solid matrix 1.15 g/cc.

\* Master Source refers to Analytics' 8-isotope mixture which is calibrated quarterly.

**Calibration Methods:** 4π LS - 4 pi Liquid Scintillation Counting, HPGe - High Purity Germanium Gamma-Ray Spectrometer, IC - Ionization Chamber. **Uncertainty:** U - Relative expanded uncertainty,  $k = 2$ . See NIST Technical Note 1297, "Guidelines for Evaluating and Expressing the Uncertainty of NIST Measurement Results."

This standard will expire one year after the calibration date.

## CERTIFICATE OF CALIBRATION Standard Radionuclide Source

73487-307

RSO# 824 Rec'd 8/29/08  
JUB

1.0 Solid in 138G GA-MA Beaker

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solution sources. The Am-241 was calibrated by 4 pi alpha liquid scintillation counting. All other radionuclides were calibrated using a germanium gamma spectrometer system. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Rev. 1, February, 1979.

US Patent 4,430,258; UK Patent GB2,149,194B; CA Patent 1,196,776.  
Density of solid matrix 1.15 g/cc.

Calibration date: July 1, 2006 12:00 EST

## CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

PAT ID 0720

66354A-307

215 Grams of Sand in Metal Can

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solution sources. The Am-241 was calibrated by 4 pi alpha liquid scintillation counting. All other radionuclides were calibrated using a germanium gamma spectrometer system. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Rev. 1, February, 1979.

Calibration date: July 1, 2003 12:00 EST
