Title: USDA-FSA-APFO Digital Ortho Mosaic

Publication_Information:

Publication_Place: Salt Lake City, Utah

Publisher: USDA_FSA_APFO Aerial Photography Field Office

Description:

Abstract:

This data set contains imagery from the National Agriculture Imagery Program (NAIP). NAIP acquires digital ortho imagery during the agricultural growing seasons in the continental U.S.. A primary goal of the NAIP program is to enable availability of ortho imagery within one year of acquisition. NAIP provides four main products: 1 meter ground sample distance (GSD) ortho imagery rectified to a horizontal accuracy of within +/- 5 meters of reference digital ortho quarter quads (DOQQ's) from the National Digital Ortho Program (NDOP); 2 meter GSD ortho imagery rectified to within +/- 10 meters of reference DOQQs; 1 meter GSD ortho imagery rectified to within +/- 6 meters to true ground; and, 2 meter GSD ortho imagery rectified to within +/- 10 meters to true ground. The tiling format of NAIP imagery is based on a 3.75' x 3.75' quarter quadrangle with a 300 meter buffer on all four sides. NAIP quarter quads are formatted to the UTM coordinate system using NAD83. NAIP imagery may contain as much as 10% cloud cover per tile. This file was generated by compressing NAIP quarter quadrangle tiles that cover a county. MrSID compression, with mosaic option, was used. Target values for the compression ratio are (15:1) and maximum number of compression levels are used.

Purpose:

NAIP imagery is available for distribution within 60 days of the end of a flying season and is intended to provide current information of agricultural conditions in support of USDA farm programs. For USDA Farm Service Agency, the 1 meter GSD product provides an ortho image base for Common Land Unit boundaries and other data sets. The 1 meter NAIP imagery is generally acquired in projects covering full states in cooperation with state government and other federal agencies who use the imagery for a variety of purposes including land use planning and natural resource assessment. With an annual cycle, NAIP is also used for disaster response often providing the most current pre-event imagery. While suitable for a variety of uses the 2 meter GSD NAIP imagery is primarily intended to assess crop condition and compliance to USDA farm program conditions. The 2 meter imagery is generally acquired only for agricultural areas within state projects.

Time_Period_of_Content:

Time_Period_Information:

Single_Date/Time:

Calendar_Date: 2006

Currentness_Reference: Acquisition years of source image Dates.

Status:

Access_Constraints: There are no limitations for access.

Use_Constraints:

Users should be aware that this is an interim release. The interim compressed county mosaic may contain defects and have horizontal accuracy less than the specified tolerances. Imagery may be replaced to address defects found in a small number of products through quality assurance processes. Imagery containing defects that require the acquisition of new imagery, such as excessive cloud cover, specular reflectance, etc., will not be replaced within a NAIP project year.

Process_Step:
Process_Description:
For the NAIP 2006 program, Colorado required the creation
of 5008 2-meter GSD resolution natural color digital
orthophoto
quarter quadrangles (DOQQs), created from color positive film.
Sanborn acquired photography using Kodak 2427 film. The film
was developed and edited. Airborne GPS was collected during
flight. Exposures were scanned at 28 microns on ZI PhotoScan
Image Scanning System. Airborne GPS data was used to
geolocate
the exposures and orient the exposures in preparation for
Aerial
Triangulation (AT). Interior orientation was performed on the
scanned images by measuring the fiducials. The correct camera
calibration information was verified. AT was performed using
Z/I
Imaging's ISAT (ImageStation Aerial Triangulation) software.
A
second generation AT approach was used, making use of both
National Elevation Data (NED) and the USDA provided baseline
orthophoto imagery. The scanned imagery was rectified using
Sanborn's proprietary METRO software, drawing on the NED data,
scans, and AT. Cubic convolution resampling was applied.
Quarter quadrangle centered photos were primarily used for
ortho
rectification. In some cases, alternate images were scanned an
rectified to avoid clouds, cloud shadows or to cover areas of
high relief. Color Balancing and Mosaicing After
rectification,
color balancing was applied and DOQQ files were extracted from

the rectified image. The separate DOQQ files were then compressed into a mosaic using Lizard Tech's MrSID (MG3) software. Metadata files were created with Sanborn's proprietary software. Two DVDs or CDs were written for each CCM using GearPro CD writing software.
