David

Attached are revised reference photos with requested information. Also, with regard to the sensitive area determination due to depth of ground water, I do not have a problem. I talked to our completions people and they said the pad will have a berm and that they can install a liner. I hope this is acceptable.

This is a temporary pad and will only be used to complete two or three pads in the area. The tanks are portable and will only contain fluid prior to fracing. The fluid is pumped down the well during fracing and the tanks will remain empty till next frac job. Once all wells are completed the tanks will be removed. I hope this takes care of all the issues for this 2A and that it can be approved. Let me know if you need anything else.

I am working on revised plats for the PA 34-4 and Federal Rulison 14-95 that show the pipeline access in the buffer area. I will try to send something for you to look at this afternoon. Let me know what you think about the Mahaffey Frac pad.

Thanks
