**RE: 2ND QUARTER GROUNDWATER INVESTIGATION REPORT FOR WILLIAMS FIELD SERVICES
IGNACIO GAS PLANT, MAY 2010**

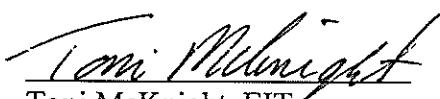

Dear Ms. Sandoval,

Enclosed please find the *2nd Quarter Groundwater Investigation Report* for groundwater sampling performed on May 12, 2010, at the Williams Field Services Ignacio Gas Plant located in the SW ¼ of Section 36, Township 34N, Range 9W, La Plata County, Colorado.

The water levels of eight (8) wells and one (1) piezometer were monitored. The piezometer (PZ-10) was found to be dry. All monitor wells were sampled and analyzed in the field for pH, temperature, and conductivity, and in the laboratory for BTEX via USEPA Method 8021 with the approval of the State of Colorado. All activities and results are discussed in the following report.

We appreciate the opportunity to be of service. If you have any questions or require additional information, please contact our office at (505) 632-0615.

Respectfully Submitted,
ENVIROTECH, INC.

INTRODUCTION

This report summarizes the groundwater monitoring of eight (8) monitor wells (MW) and one (1) piezometer (PZ) at the Williams Field Services Ignacio Gas Plant. The site is located in the SW ¼ of Section 36, Township 34N, Range 9W, La Plata County, Colorado; see *Figure 1, Vicinity Map*. Activities in this report include sampling, laboratory analysis, documentation, and reporting.

The site has a moderate topographic relief of approximately 80 feet, with the surface gradient to the south and east towards Pine Creek. The site is located on an outcrop of Tertiary age dark marine shale sediments, believed to be the Nacimiento Formation.

ACTIVITIES PERFORMED

A *Sampling and Analysis Plan* was developed according to Section 2.2 of the State of Colorado groundwater protection rules. Prior to sampling, water levels were measured and a minimum of three (3) casing volumes were purged. Samples collected from the monitoring wells were analyzed in the field for pH, temperature, and conductivity and in the laboratory by USEPA Method 8021 for BTEX with the approval of the State of Colorado. Eight (8) wells and one (1) piezometer are located on the site.

On May 12, 2010, samples were collected from the eight (8) monitor wells, with the piezometer (PZ-10) being dry at the time of sampling. Samples were collected from MW-8, MW-11, MW-12, MW-4, MW-9, MW-2, MW-7, and POC-1. The samples were analyzed in the field for pH, temperature, and conductivity, and in the laboratory for BTEX via USEPA Method 8021 with the approval of the State of Colorado.

One (1) monitoring well had a benzene value above the State of Colorado regulatory standard of 5.0 ppb (MW-8 at 325 ppb); see *Figure 3, Benzene Iso-Concentration Map* and *Table 1, Laboratory Results of Groundwater Sample Analyses*. Benzene levels increased in MW-8 since the previous sampling event. MW-8 is located adjacent to the evaporation lagoon. A submersible pump was installed on MW-8 by Williams Field Service to purge groundwater from the well for approximately one (1) hour per day since July 22, 2009; however, groundwater had not been purged for approximately two (2) weeks prior to the sampling event. No other contaminants of concern exceeded State of Colorado water regulation standards in any of the monitoring wells; however, sample results from MW-2 and MW-9 showed low levels of benzene. MW-9 and MW-2 are located down-gradient of the evaporation lagoon. The benzene results observed in these wells were below the 5.0 ppb State of Colorado regulatory standard. Laboratory Certificates of Analyses are included; see *Appendix A, Laboratory Certificates of Analyses*.

The water quality analysis shows high conductivity in the area surrounding the evaporation lagoon. MW-11 and MW-12, the furthest upgradient wells sampled, exhibited conductivity reading of 1.14 mS and 1.55 mS; see *Appendix B, Field Notes*. These readings are

considered to be the background level. Conductivity readings in wells MW-2, MW-4, MW-7, MW-8, and MW-9, which surround the evaporation lagoon, ranged from 3.79 mS to 15.78 mS. The furthest downgradient well, POC-1, exhibited a conductivity reading of 1.29 mS, which is much lower than the elevated conductivity readings around the evaporation lagoon. The POC-1 conductivity readings were similar to the background determined for this site.

A water table map is presented as *Figure 2, Water Level Map* and shows various water gradients ranging from 0.0163 ft/ft at the north edge of the site to 0.163 ft/ft at the southeast edge of the site near Pine Creek. Water table measurements are summarized in *Table 2, Water Level Measurements*.

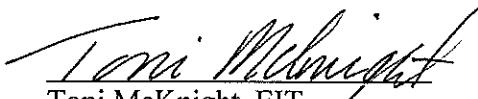

CONCLUSIONS AND RECOMMENDATIONS

Envirotech, Inc. has completed the quarterly monitoring activities for monitor wells at Williams Field Services Ignacio Gas Plant. At present there does not appear to be any migration of contaminants offsite from the lagoon or plant. Over the previous three (3) sampling events, the benzene levels in MW-8 have decreased significantly from 413.0 ppb to 41.4 ppb. The previous decrease in benzene levels in MW-8 may have been the result of daily purging of groundwater from the well. The increase in benzene levels in MW-8 during the current sampling event may be due to the discontinued purging of groundwater from the well. Over the previous three (3) sampling events, the benzene levels in MW-2 have increased from < 0.2 ppb to 6.5 ppb. The decrease in benzene levels in MW-2 during the current sampling event could be due to the increase in the groundwater elevation. MW-2 is located down-gradient from the evaporative lagoon and MW-8. Envirotech, Inc. recommends the installation of additional monitoring wells around the evaporation lagoon to better delineate possible migration of contaminants offsite from the lagoon or plant. These proposed monitoring wells are PMW-13, PMW-14, PMW-15, and PMW-17; see *Figure 3, Benzene Iso-Concentration Map*. The piezometer (PZ-10) has been dry since 2006 indicating that the evaporative pond may not be leaking. MW-12 appears to have been damaged and the casing is obstructed, not allowing a full three (3) volumes of purge before sampling. Envirotech, Inc. recommends continued sampling until constituents in all monitor wells are below State of Colorado groundwater regulatory levels.

The undersigned has conducted this service at the above referenced site. This work has been conducted and reported in accordance with generally accepted professional practices in geology, engineering, environmental chemistry, and hydrogeology.

Benzene	ND	1	0.2
Toluene	ND	1	0.2
Ethylbenzene	ND	1	0.2
p,m-Xylene	ND	1	0.2
o-Xylene	ND	1	0.1
Total BTEX	ND		

ND - Parameter not detected at the stated detection limit.

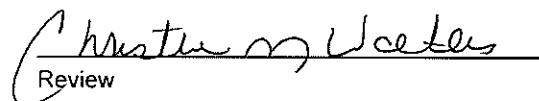

Surrogate Recoveries:	Parameter	Percent Recovery
	fluorobenzene	100 %
	1,4-difluorobenzene	105 %
	4-bromochlorobenzene	111 %
