Cause of spill (e.g. equipment failure, human error, etc.): <u>Human Error</u>		
Detailed description of the spill/release incident: Water truck driver was transferring water from his truck to a frac tank on location. The man hatch was not tightened and the driver did not check the hatch prior to transferring his load. The loose man hatch allowed the treated produced water to run out onto the well pad. The entire release was contained on the well pad. No live water was affected by the release.		

**CORRECTIVE ACTION**

Describe immediate response (how stopped, contained and recovered): The loose man hatch re-tightened and transfer of water to the tank was immediately halted. The driver then used his truck to vacuum off the free standing liquid on the pad. The amount recovered is unknown since he still had a partial load on the truck.
Describe any emergency pits constructed: None were constructed
How was the extent of contamination determined? By field measurements and mapping with a Trimble GPS unit.
Further remediation activities proposed (attach separate sheet if needed): Field screening results indicated hydrocarbon concentrations below COGCC criteria of 500 ppm TPH. A confirmation has been collected and submitted to confirm these results. Remedial actions will be dependant on the laboratory results.
Describe measures taken to prevent problem from reoccurring: The trucking company responsible for the release has reviewed their required SOP's when transferring water from water trucks to a frac tanks with special emphasis placed on checking all valves, hatches, and staying at the frac tank when transferring water. The review took place with all personnel involved with fluid transfers on a location.
