

6/18/2012 11:35am Linda Spry O'Rourke called Charlie Jensen

Charlie reported that he is currently collecting soils for Table 910-1 series. The field unit with chloride strips is reporting negative on all samples. CDPHE report said 100 BBLs released; Charlie reports they did not have an estimate, so he doesn't know where the 100 BBL number came from. Their calculations look like 51 BBLs were released. The Vac truck pulled 240 BBLs of water, which included water from the Davis Ditch as they attempted to get any impacted water vacuumed up. Charlie reported that the line is pressurized and the operator saw a quick pressure drop in the line, which indicates the failure occurred rapidly. The pipeline has been repaired and will be pressure tested tomorrow. The hole where the release occurred is still open pending the pressure test.
