Kevin and David,

The Shideler 30-2C well on the O19EB pad has developed a high of 140 psi of bradenhead pressure yesterday. We are going to continue to monitor and bleed this well as necessary to keep the pressure under 150 psi.

Thanks,

Gage Soehner

Drilling Engineer SRBU

Gage,

Thanks, and please include your monitoring results on Encana's forthcoming Request to Complete. Apparently, this pressure developed after the CBL deferment request, because that was showing all zeros for bradenhead pressure.

Yes it did develop pressure after the initial 72 hour bradenhead monitoring. We will continue to monitor until the rig is off the pad and record these pressures. Thanks

All,

I would like to update you on this well. We are continuing to vent this well to keep it under 150 psi. We are recording pressures in the AM and PM, and are constantly monitoring this well, bleeding it as necessary.

Thanks,

Gage
