

12/14/01: Hydrotest tubing into hole and found 1 jt with a hole. PU 15 additional jts and tag sand at 8493'.

Circ sand to 8510'. J perfs at 8552-8558'. Hit hard spot at 8520' and started loosening fluid. Rotated and jarred on hard sand.

Did not make any hole. Pull 5 stands and SI overnight.

12/15/01: Jarred and rotated on hard spot. Made 1'. RU power swivel and drilled thru hard spot. Circulated sand down to 8556'. Lost circulation. Landed 267 jts with seating nipple at 8525'. MU wellhead and broached tubing and SI to build pressure.

Going along the same lines, in regards to the KW 1,2,3 and 5 wells, how do I know which numbers correspond with which well? There are 5 lists of production numbers, but I only see 4 KW wells...?

Also, the statement only lists the Nick Hager well, but the system only indicates the Hager Properties, which I know the Nick is a part of. Will we be getting the rest of the Hager well's numbers soon?

I am figuring out the system fine, I just don't know which numbers go to some of these wells since the statement does not specifically say.

Thanks

Nick
