Describe what is known about the spill/release event (what happened -- including how it was stopped, contained, and recovered):

A drain valve froze on the back of the condensate tank. Approximately 20 bbls of condensate leaked out of the tank through the compromised valve and into the impervious-plastic-lined SPCC containment. The entire release was contained within containment. No fluids escaped the containment. 100 % of the volume released was recovered by a vac truck.
