COMMENTS:

Following the current investigation regarding stray gas (remediation work plan 8936), this plan is presented in case the results from the CBL show that no adequate coverage is present above the Sussex and/or the under the Fox Hills. A MIT will be performed prior to running the CBL.

Based on the completion reports, the calculated TOC is at 3,855' which is 880' above the top of the Sussex, so no remedial cement is anticipated. The completion report also indicates that 200 sacks were pumped with a DV tool set at 1001', which would cover 134' below the base of the Fox Hills (log indicates base of Fox Hills at 867') and would bring the cement to 125' from surface. In case the CBL does not show adequate coverage at least to 4,535' and/or the bottom of the staged cement is above 917', 1 sack of cement will be pumped for every 4' of cement coverage required above the Sussex and over the Fox Hills.

If the casing does not hold the pressure per rule 326, the leak will also be repaired with 1 sack of cement for every 4' of 4.5" casing. Initial method will be an annular fill with 1" tubing. If circulation is not achieved, the production casing will be perforated and the cement will be squeezed. Results of the CBL and MIT will be submitted to the Engineer before commencing remedial operations.
