COMMENTS:

In accordance with COGCC Rule 907 for the management of exploration and production (E&P) waste, Encana collects representative samples of potentially impacted material on each of its locations for the purpose of comparing constituent levels to the allowable limits identified by the COGCC. All samples collected on behalf of Encana's Parachute Field Office are collected and documented in accordance with the Environmental Department's Sampling Procedures. Area background samples are also collected to establish a baseline for naturally occurring concentrations/levels for applicable constituents of concern. Field sampling documentation and laboratory reports not provided with this form are kept on file at the Parachute Field Office and are available upon request. Report of work completed is on date of sampling event that clears impacted soil. Pre Excavation sampling identified arsenic, Sodium Absorption Ratio [SAR], Electric Conductivity [EC], Benzene, and Total Petroleum Hydrocarbons to be above the COGCC 910-1 table. Approximately 100 cubic yards of impacted material was excavated and transported under disposal manifests to ECDC Landfill in East Carbon, Utah. Vertical and Lateral definition was obtained through field screening, visual markings, and sampling. Post excavation laboratory reports confirmed impacted material was below the COGCC table 910-1. Consistent with reclamation objectives and approved handling of material with high levels of SAR and EC, the pit bottom and impacted material was covered by more than three feet (3') of clean native fill and topsoil during backfilling operations. Lab reports also identified arsenic to be above the COGCC table 910-1, but are within the background limits of the area. This Sundry is being submitted as the Notification of Completion for Remediation # 8635. If the information provided is satisfactory, please provide a letter of No Further Action (NFA) and documentation of the closure for this remediation project and pit.
