Describe what is known about the spill/release event (what happened -- including how it was stopped, contained, and recovered):

DCP overfilled a tank located at the Spindle Gas Processing Plant with condensate and water on 9-22-15. It appears we had a dump valve malfunction on our heater treater which normally dumps the water off to TK-5132 and the condensate to a pressurized tank. The float that alarms operations and controls the dump valve of an overflow in the tank rides up and down on a 1" shaft and DCP believes this became stuck and as a result the operator didn't see the level spike. A DCP roustabout crew onsite noticed it overflowing and notified the operators immediately. The spill was contained in a concrete containment and was approximately 12 barrels. DCP has contacted a 3rd party to remove the condensate from the containment and the tank within the hour and pumped it back into our stabilizer system. DCP is conducting a formal investigation on this event to not only find the exact cause but to take all future measures possible to prevent the reoccurrence of the event.
