

EXHIBIT G – SITE FACILITY DESCRIPTION – FEDERAL 5-35

CURRENT INJECTION FACILITIES:

The current injection facility consists of five tanks (400 barrel capacity). One of which is a wash tank which produced fluid flow into to be separated into water and condensate. One tank stores the produced condensate. The remaining three tanks store produced water. The current injection line runs from the State 4-36 Tank Facility to the Federal 1-35 injection well.

PROPOSED INJECTION FACILITIES:

The proposed conversion of Federal 5-35 would require running approximately 290' of new 2" underground flow line from the Federal 1-35 location to the Federal 5-35 well head as shown on the diagram with a red dotted line.
