EXECUTIVE SUMMARY

This report was prepared by LT Environmental, Inc. (LTE), under the direction of Encana Oil & Gas (USA), Inc., to document soil assessment activities at the Encana Production Pad #1321 (Site). The Site is located approximately 20 miles south-west of Rangely, Colorado.

The scope of work for this project included assessing residual petroleum hydrocarbon impacts following the identification of a release associated with a partially buried produced water corrugated steel holding tank. The source of the release was identified when the buried holding tank was removed. Additionally, the soil immediately surrounding the tank was excavated and removed on November 15, 2011 by HCSI, Environmental Consultants. Activities included advancing soil borings on site and collecting soil samples to submit for laboratory analysis, health and safety monitoring, drilling contractor oversight, and preparation of this summary report.

On August 27 and 28, 2012, Site Services Drilling Company of Golden, Colorado, was contracted to advance seven soil borings on site to depths ranging from 2.5 to 26.5 feet below ground surface. Soil borings were advanced with hollow-stem augers. All soil borings were conducted within the production pad disturbance; therefore no borings were outside the pad disturbance on Bureau of Land Management land.

Based on analytical results from soil boring samples collected during assessment activities, all impacted soil has naturally attenuated to within compliance standards of the Colorado Oil and Gas Conservation Commission Table 910-1 Concentration Levels.

No groundwater was encountered during the assessment activities. All soil borings were backfilled with soil generated from the borings during assessment drilling activities.

1.0 INTRODUCTION

LT Environmental, Inc. (LTE), under the direction of Encana Oil & Gas (USA), Inc. (Encana), was contracted to document soil assessment activities at the Encana Production Pad #1321 (Site). The purpose of this project was to assess any residual hydrocarbon impacted soil remaining at the Site. A release of petroleum hydrocarbons was identified when a partially buried produced water corrugated steel holding tank was excavated and removed from the Site.

On November 15, 2011, Encana removed the buried production tank along with any observed hydrocarbon impacted soil associated with the Site as depicted on Figure 2. Tank removal and excavation of soil was conducted by HCSI, Environmental Consultants. A summary of these activities is attached in Appendix A. The buried production tank was installed prior to the development of the current liquid containment systems. At the time of excavation activities, Encana attempted to remove all associated hydrocarbon impacted soil, however the excavation extents were limited due to technical considerations, health and safety concerns, and property boundaries. Residual total petroleum hydrocarbon (TPH) concentrations of 5,900 milligrams per kilogram (mg/kg) remained in soil at the base of the excavation, 2,900 mg/kg on the south sidewall, and 1,920 mg/kg on the north sidewall. Excavation soil sample analytical results are summarized in Table 1. These concentrations exceeded the Colorado Oil and Gas Conservation Commission (COGCC) standard of 500 mg/kg, thus determining the need to assess the remaining soil conditions at the Site. Encana also collected background soil samples at the time of excavation activities, which are indicated in Table 2.

On August 27 and 28, 2012, LTE advanced seven soil borings at the Site to assess residual TPH concentrations in soil identified during production tank removal. All soil samples results were within the compliance standards of the COGCC, thus indicating that the residual hydrocarbon impacted soil has naturally attenuated to acceptable levels.

1.1 SITE DESCRIPTION

The Site is located approximately 20 miles south-west of Rangely, Colorado. The legal description of the Site is the southeast quarter of the southeast quarter of Section 24, Township 2 South, Range 103 West of the Sixth Principal Meridian in Rio Blanco County, Colorado (Figure 1). The Site is surrounded by Bureau of Land Management (BLM) property.

The general site geology was observed as a predominantly brown silty-sand and gravel down to a competent yellow-brown sandstone.

The Site is located at an elevation of 6,636 feet above mean sea level in an area with localized high plateau topography associated with the western edge of the Rocky Mountains near the Colorado Plateau.

1.2 SCOPE OF WORK

The scope of work for this assessment project included advancing soil borings at the Site and collecting soil samples below the previous excavation and laterally outward from the initial source area.

During on-site assessment activities, LTE personnel conducted field screening of soil samples, soil sampling, borehole logging, health and safety monitoring, and documentation of field activities.

A summary of field activities, analytical results from soil sampling, and conclusions are presented in the subsequent sections.

2.0 SUMMARY OF FIELD ACTIVITIES

2.1 ASSESSMENT ACTIVITIES

On August 27 and 28, 2012, LTE advanced seven soil borings (1321-CB01-082712 through 1321-CB07-082812) to depths ranging from 2.5 to 26.5 feet below ground surface. LTE contracted Site Services Drilling Company of Golden, Colorado, to install the soil borings using a CME-75 drill rig equipped with hollow-stem augers.

The soil borings were logged by an LTE environmental scientist who inspected the soil for the presence or absence of petroleum hydrocarbon odor and/or staining. The soil was characterized by visually inspecting the soil samples collected in 2-foot long split-spoon samplers and field screening the soil headspace using a photo-ionization detector (PID) to monitor for the presence of volatile organic vapors. The soil boring logs are included in Appendix B.

Soil samples were collected from each soil boring and submitted with a completed chain-of custody form to ESC Lab Sciences of Mt. Juliet, Tennessee (ESC), for analysis of TPH-diesel range organics (DRO), TPH-gasoline range organics (GRO), benzene, toluene, ethylbenzene, and total xylenes (BTEX). Samples were collected and submitted for laboratory analysis were only analyzed for these analytes due to exceedances of the COGCC Concentration Levels at the time the culvert pit was removed. All other constituents were below COGCC Concentration Levels or were within background concentration allowances.

2.2 ASSESSMENT FINDINGS

Soil conditions at the Site were identified as a brown silty-sand and gravel extending from the surface to approximately three feet bgs at which point a dense yellow-brown sandstone was encountered. Auger refusal at the sandstone layer determined the vertical depth of each soil boring with the exception of 1321-CB01-082712 and 1321-CB02-082712. Refusal from 2.5 to 4 feet bgs was encountered south and southwest of the old tank location. Groundwater was not encountered in any of the soil borings during drilling activities.

All soil samples were screened using a PID and placed in laboratory-prepared, wide-mouth glass sample jars for laboratory submittal. Soil sample 1321-CB01-082712 registered a minor PID readings of 11 and 2 parts per million. No other soils samples that were field screened were observed to have significant PID readings, hydrocarbon odors, or staining.

On December 5, 2012, Encana sampled stockpiled soil from the November 2011 excavation activities. Soil sample 1321-SPOILS-120512 was submitted to ESC for laboratory analysis of TPH-GRO, TPH-DRO, and BTEX. The stockpiled soil has been land-farmed onsite and was

again resampled on August 25, 2103 for COGCC Table 910-1 parameters. Arsenic and SAR levels exceeded the COGCC Table 910-1 concentration levels; however, these two exceedances will be addressed when final reclamation of the pad occurs after all production activities are terminated.

3.0 ANALYTICAL RESULTS

Soil samples collected from all soil borings confirmed that the hydrocarbon impacted soil exceeding regulatory standards has naturally attenuated since the excavation activities in November of 2011. Soil sample laboratory analytical results are illustrated on Figure 3 and summarized in Table 3.

Spoils stockpiled soil sample laboratory analytical results are summarized in Table 4. Copies of the laboratory analytical reports are included in Appendix C.

4.0 SUMMARY AND CONCLUSIONS

LTE was contracted by Encana to conduct soil assessment activities at the Encana Production Pad #1321 to assess any residual hydrocarbon impacted soil and/or groundwater following the identification of a release associated with a partially buried produced water corrugated steel holding tank. The tank was removed and associated hydrocarbon impacted soil excavated in November of 2011.

On August 27 and 28, 2012, LTE field personnel observed the installation of seven soil borings on the Site. Four borings were abandoned due to auger refusal. The three soil borings were advanced on site to depths ranging from 7 to 26.5 feet bgs. Soil samples were collected from soil borings 1321-CB01-082712 through 1321-CB03-082812. No groundwater was encountered during the assessment activities.

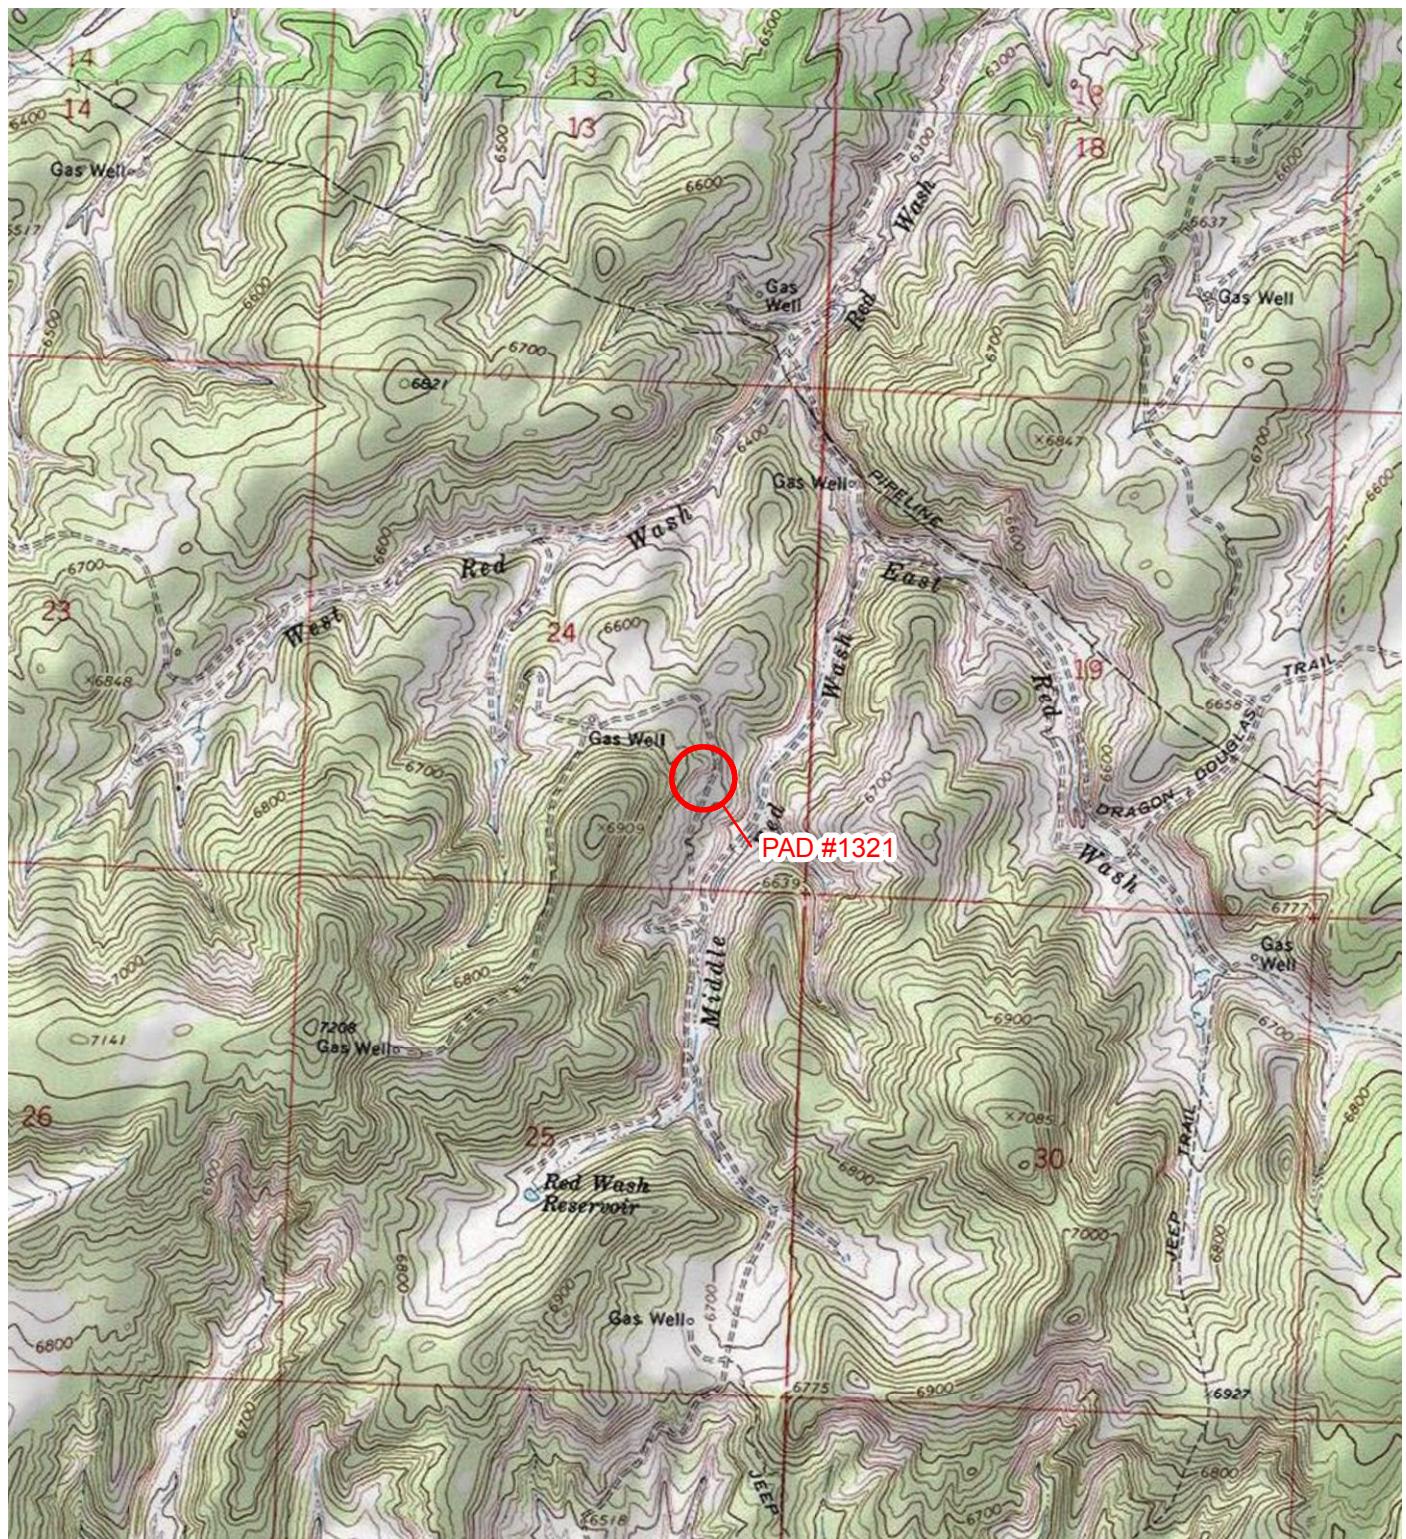

Four soil samples were submitted to ESC for laboratory analysis of TPH-DRO, TPH-GRO, and BTEX. Analytical results from all soil boring samples indicated hydrocarbon impacted soil has naturally attenuated to within the compliance standards of the COGCC. All soil borings were backfilled with soil removed from the borings generated during assessment activities. Additional activities included on-site health and safety monitoring and preparation of this summary report.

On December 5, 2012, Encana sampled stockpiled soil from the November 2011 excavation activities. The stockpiled soil has been land-farmed onsite and was again resampled on August 25, 2103. Arsenic and SAR levels exceeded the COGCC Table 910-1 concentration levels; however, these two exceedances will be addressed when final reclamation of the pad occurs after all production activities are terminated.

Therefore, LTE recommends that Encana Site #1321 be granted closure regarding Remediation Number 6731 and that the COGCC provide closure documentation to Encana with regard to this recommendation.

Dear Mr. Ford,

This document has been provided per your request for a summary of actions taken during the pit closure site investigation associated with the Dragon Trail Unit #1321 (COGCC facility #315935, COGCC remediation #6731) by HRL Compliance Solutions, Inc. (HCSI) personnel during the 2011 field season. Please see below for the respective summary.

November 10, 2011

The pit investigation was initiated by qualified Encana personnel. A grab sample from directly under the tank was collected with regards to the COGCC Table 910-1 constituents and submitted to the analytical laboratory for analysis.

November 15, 2011

The site investigation was conducted by a qualified HCSI employee as authorized by Encana personnel. All samples were collected in accordance with the protocol specified within Encana Environmental Compliance Group's Sampling Procedures.

The associated culvert was carefully removed and stored onsite for later disposal or recycling. There was no liquid associated with the pit at the time of investigation. A trackhoe was utilized during the site investigation for excavation purposes. The soil associated with the pit investigation was characterized utilizing a photoionization detector (PID) throughout the excavation process. There were strong indicators of hydrocarbon impacts in accordance with visual indicators and the field screen readings (>5,000 ppm). The substrate surrounding the pit and immediately beneath the grounds surface, was characterized by sandstone slabs ranging from one to three feet in thickness. It appeared that the bedrock where the pit was placed had been jackhammered or removed with considerable force. The substrate beneath the sandstone slabs was very rocky. The excavation activity was stopped due to the proximity to equipment, and concerns pertaining to safety due to the depth of the excavation and stability of the sandstone slabs around the excavations perimeter. The final excavation was approximately 30'W x 20'L x 25'D. Approximately 450 cubic yards of soil was removed during the excavation. Grab samples were collected from the pit side walls, spoils and pit bottom. The respective samples were

submitted for analysis with regards to specified COGCC Table 910-1 constituents. Background samples (with respect to arsenic) were collected as well from undisturbed land surrounding the well pad. Per conversation with the Encana project manager, the excavation was backfilled with soil from the pads working face while the soils excavated during the pit investigation were stockpiled onsite.

The analytical reports indicated that the grab sample collected from under the tank and two of the side walls exceeded the COGCC Table 910-1 standards with regards to total petroleum hydrocarbons (TPH). The sample collected from under the tank was also in exceedance with regards to benzene (Please see the attached Analytical Table and the Site Investigation Map for specifics).

HCSI made the recommendation to continue the pit investigation via push mounted drill rig due to the proximity to equipment and underlying geologic condicions of the well pad. A Receptor Survey was conducted during the 2011 project activities with regards to surface and groundwater features associated with the well pad. Please see below for the Receptor Survey details.

Receptor Survey

A receptor survey (survey) for the Dragon Trail #1331 well pad was conducted by an HCSI employee during the site investigation. The survey was conducted with regards to proximity to surface water features and areas with potential ground water interaction. The respective well pad located on a hill slope. The well pad has an eastern aspect. The surrounding topography is steep. Surrounding vegetation was dominated by sage, pinyon and juniper.

Surface Water

There were no surface water supply areas as defined by the COGCC Series Rules 100 definition adjacent to, or within a quarter mile of the well pad. There was one surface water feature within a quarter mile of the well pad. The Middle Red Wash, classified by the USGS as ephemeral, is approximately 570 feet to the east. Please see the site map for details pertaining to the surface water features. In the event of a release on location, the surface flow would likely migrate to the south. Potential impact to surface water is dependent on the environmental conditions during the time of the release but remains low. A release onsite would migrate into the associated bar ditch before traveling over the road and down gradient to the drainage.

Groundwater

The respective well pad did not have any pits which were holding liquid during the site investigation or receptor survey. There was one pit onsite, which was investigated in accordance with this report. The historic pit was considered a production pit. The respective well pad is not underlain by an unconfined aquifer or recharge zone in accordance with the surrounding topography. It should be noted that no groundwater was

encountered during the site investigation. Per the soil survey for the respective area, the underlying soil type is the Moyerson stony clay loam, 15 to 65 percent slopes. The hydraulic conductivity of the respective soil is 9.25700×10^{-5} cm/sec. There are not any domestic water wells, or public water supply wells within a mile radius of the respective well pad. The well pad is not located within a 100 year floodplain. The survey did identify vegetation that could be used as an indicator of shallow groundwater (e.g., cattails, rushes) in association with the Middle Red Wash, but did not identify any in the immediate area surrounding the well pad. In accordance with the receptor survey and site investigation, the potential to impact ground water is moderate.

Respectfully,

HRL Compliance Solutions, Inc.

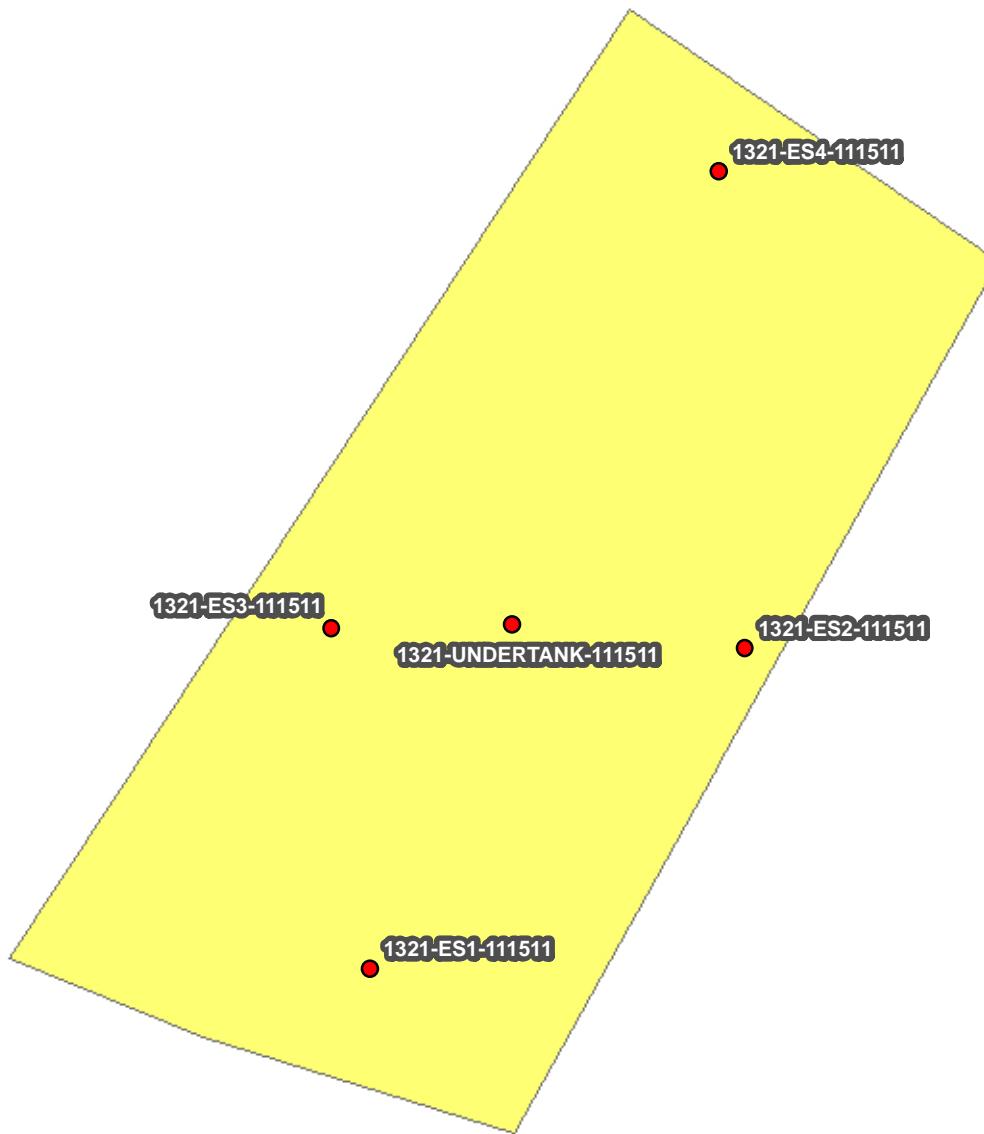

Kate Ramsay
Environmental Consultant

cc: Chantae Pennell (Encana – Rangely)
Herman Lucero (HCSI)

Attachment A
List of Analytes with QC Qualifiers

Sample Number	Work Group	Sample Type	Analyte	Run ID	Qualifier
L547692-01	WG566488	SAMP	Acenaphthene	R1938792	J3
	WG566488	SAMP	Naphthalene	R1938792	J3
	WG566488	SAMP	Nitrobenzene-d5	R1938792	J7
	WG566488	SAMP	2-Fluorobiphenyl	R1938792	J1
	WG566476	SAMP	o-Terphenyl	R1940092	J7

Attachment B
Explanation of QC Qualifier Codes

Qualifier	Meaning
J1	Surrogate recovery limits have been exceeded; values are outside upper control limits
J3	The associated batch QC was outside the established quality control range for precision.
J7	Surrogate recovery limits cannot be evaluated; surrogates were diluted out

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

Accuracy - The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.

Precision - The agreement between a set of samples or between duplicate samples. Relates to how close together the results are and is represented by Relative Percent Difference.

Surrogate - Organic compounds that are similar in chemical composition, extraction, and chromatography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.

TIC - Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

The data package includes a summary of the analytic results of the quality control samples required by the SW-846 or CWA methods. The quality control samples include a method blank, a laboratory control sample, and the matrix spike/matrix spike duplicate analysis. If a target parameter is outside the method limits, every sample that is effected is flagged with the appropriate qualifier in Appendix B of the analytic report.

Method Blank - an aliquot of reagent water carried through the entire analytic process. The method blank results indicate if any possible contamination exposure during the sample handling, digestion or extraction process, and analysis. Concentrations of target analytes above the reporting limit in the method blank are qualified with the "B" qualifier.

Laboratory Control Sample - is a sample of known concentration that is carried through the digestion/extraction and analysis process. The percent recovery, expressed as a percentage of the theoretical concentration, has statistical control limits indicating that the analytic process is "in control". If a target analyte is outside the control limits for the laboratory control sample or any other control sample, the parameter is flagged with a "J4" qualifier for all effected samples.

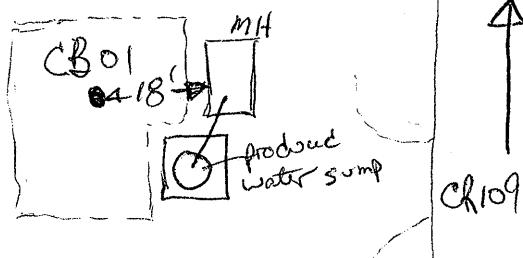

Matrix Spike and Matrix Spike Duplicate - is two aliquots of an environmental sample that is spiked with known concentrations of target analytes. The percent recovery of the target analytes also has statistical control limits. If any recoveries that are outside the method control limits, the sample that was selected for matrix spike/matrix spike duplicate analysis is flagged with either a "J5" or a "J6". The relative percent difference (%RPD) between the matrix spike and the matrix spike duplicate recoveries is all calculated. If the RPD is above the method limit, the effected samples are flagged with a "J3" qualifier.

The data package includes a summary of the analytic results of the quality control samples required by the SW-846 or CWA methods. The quality control samples include a method blank, a laboratory control sample, and the matrix spike/matrix spike duplicate analysis. If a target parameter is outside the method limits, every sample that is effected is flagged with the appropriate qualifier in Appendix B of the analytic report.

Method Blank - an aliquot of reagent water carried through the entire analytic process. The method blank results indicate if any possible contamination exposure during the sample handling, digestion or extraction process, and analysis. Concentrations of target analytes above the reporting limit in the method blank are qualified with the "B" qualifier.

Laboratory Control Sample - is a sample of known concentration that is carried through the digestion/extraction and analysis process. The percent recovery, expressed as a percentage of the theoretical concentration, has statistical control limits indicating that the analytic process is "in control". If a target analyte is outside the control limits for the laboratory control sample or any other control sample, the parameter is flagged with a "J4" qualifier for all effected samples.

Matrix Spike and Matrix Spike Duplicate - is two aliquots of an environmental sample that is spiked with known concentrations of target analytes. The percent recovery of the target analytes also has statistical control limits. If any recoveries that are outside the method control limits, the sample that was selected for matrix spike/matrix spike duplicate analysis is flagged with either a "J5" or a "J6". The relative percent difference (%RPD) between the matrix spike and the matrix spike duplicate recoveries is all calculated. If the RPD is above the method limit, the effected samples are flagged with a "J3" qualifier.

Qualifier	Meaning
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

Accuracy - The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.

Precision - The agreement between a set of samples or between duplicate samples. Relates to how close together the results are and is represented by Relative Percent Difference.

Surrogate - Organic compounds that are similar in chemical composition, extraction, and chromatography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.

TIC - Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

Report Summary

Friday September 06, 2013

Report Number: L654177

Samples Received: 08/27/13

Client Project: 033412042

Description: Rangley Site Assessment

The analytical results in this report are based upon information supplied by you, the client, and are for your exclusive use. If you have any questions regarding this data package, please do not hesitate to call.

Attachment A
List of Analytes with QC Qualifiers

Sample Number	Work Group	Sample Type	Analyte	Run ID	Qualifier
L654177-01	WG679071	SAMP	Chromium, Hexavalent	R2796682	J60

Attachment B
Explanation of QC Qualifier Codes

Qualifier	Meaning
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low
O	(ESC) Sample diluted due to matrix interferences that impaired the ability to make an accurate analytical determination. The detection limit is elevated in order to reflect the necessary dilution.

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

Accuracy - The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.

Precision - The agreement between a set of samples or between duplicate samples. Relates to how close together the results are and is represented by Relative Percent Difference.

Surrogate - Organic compounds that are similar in chemical composition, extraction, and chromatography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.

TIC - Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.
