I have reviewed the well file and inspections reports and find no reason to believe this well poses any threats to ground water at this time. The well was completed in 1988 with surface casing set at 212' which is 117' shallower than the deepest water well within a one mile (1 mi) radius; however, there is intermediate casing set at 1495'. Perhaps the closest water wells could be tested. A Braden head test might be conducted based on those results. The well has not produced since NOV 2014 due to a distressed operator. There are some surface BMP's and minor equipment issues.
