COMMENTS:

Add one (1) water tank, two (2) separators, two (2) electric motors, one (1) VOC combustor, three (3) oil tanks, and one (1) flare. Therefore, the new totals are two (2) water tanks, four (4) separators, two (2) electric motors, two (2) VOC combustors, six (6) oil tanks, and two (2) flares.

One buried gas pipeline is utilized to gather gas production from the location. The main pipeline is constructed of 3 inch nominal diameter SDR 13.5 HDPC 4710 pipe engineered to handle design pressures. The pipeline originates on location and terminates at a larger mainline off of the pad. One flowline is installed from each wellhead to a separator carrying multiphase flow. During production, the flow is from the wellhead to the production facility. Each buried flowline is a 3 inch steel pipeline and approximately 170 feet in length.

Two (2) line begin from each separator. The first line from the separator is a gas line routed to the gas pipeline described above. The second line from the separator is a liquid line connected to a treater. The treater then has three (3) lines originating from it: one line to the flares/combustor; one line to the oil production tanks; and one line to the water tanks.

The modification of this existing oil & gas location was within the disturbed area, and there was no additional surface disturbance. In addition, the modification did not change the cultural distances included on the most recent Form 2A.
