Per Rule 303.b.(3)C, description of all oil, gas, and/or water pipelines:

One buried gas pipeline is utilized to gather gas production from location. The main pipeline is constructed of 3 inch nominal diameter SDR 13.5 HDPC 4710 pipe engineered to handle design pressures. The pipeline originates on location and terminates at a larger mainline off of the pad. One flowline is installed from the wellhead to the separator carrying multiphase flow. During production, the flow is from the wellhead to the production facility. This buried flowline is a 3 inch schedule 40 steel pipeline and approximately 220 feet in length.

Two (2) lines begin from the separator. The first line from the separator is a gas line routed to the pipeline described above and the second line is a liquid line connected to a treater. The treater then has three (3) lines originating from it: one line to the flare; one line to the oil production tanks; and one line to the water tanks.
