

**Petroglyph Energy, Inc.**  
**Well Pad Final Reclamation Evaluation**

---

**Well Name:** Lively 34-09

**Evaluation Date:** July 15, 2015

**Evaluated by:** Lindsey Brandt; Senior Environmental Scientist; Habitat Management, Inc.  
Tony Matthews; Environmental Scientist; Habitat Management, Inc.

**Current Condition**

The Lively 34-09 pad has well-established perennial grasses and shrubs throughout the site, including western wheatgrass (*Pascopyrum smithii*), sand dropseed (*Sporobolus cryptandrus*) and tumblegrass (*Schedonnardus paniculata*). It is difficult to determine the extent of this well pad and based on a visual evaluation it is unclear whether a pad was ever constructed in this location.

Three vegetation cover transects were collected on the pad (see Lively 34-09 map) for comparison to undisturbed area reference transects collected from the surrounding soil type area. Transect data are provided in the table below. Lively 34-09 shows 43% cover of perennial native vegetation, while the reference area shows 49%. Eighty percent of the reference cover is therefore 39% ( $49 \times 0.8$ ) and the well pad meets the standard for final reclamation. These data indicate that the pad is ready for bond release and currently supports a sustainable perennial plant community. Photographs of current conditions and vegetation transects are provided on the attached page.

**Recommended Actions**

A request for reclamation liability release should be filed with the COGCC. No vegetation management actions are recommended at this time as desirable vegetation is well established and no noxious weeds were observed on the pad. The site should be checked periodically to inspect for infestations of other noxious weeds, and identify other issues that may arise and potentially impact successful reclamation.
