OPERATOR COMMENTS AND SUBMITTAL

Comments

- While cementing the 7" intermediate casing string we incurred lost fluid returns. After pumping the required cement and spacer fluid, the well began to return fluid to surface. We attempted several times to shut in the well and allow sufficient time for cement to set. After 9 hours, cement set up and flow discontinued.
- After tripping in the hole with the lateral BHA assembly to drill out float equipment, we encountered a tight spot in the 7" cased hole at 7390' MD.
- We tripped out of the hole and ran a caliper log to depth. The caliper log confirmed collapsed 7" casing at 7386' MD.
- We ran a CBL to depth and identified the estimated TOC at 6564' MD. The Niobrara top is at 7248' MD.
- As a result, we made the decision to openhole sidetrack to avoid the section of collapsed casing.
- The total measured depth of the wellbore which we are abandoning is 7860' MD.
- The 9-5/8" surface casing string is set and cemented at 1549.5' MD
- The 7" intermediate casing string is set at 7845.8' MD. The estimated TOC is at 6564'.
- There is a CIBP set inside the 7" casing string at 6741' MD.
- The 7" casing string will be cut at 1900' MD and removed from the wellbore, leaving behind 8-3/4" open hole between the surface casing shoe at 1549.5' MD and the cut 7" casing string at 1900' MD'
- There will be a 400' cement plug pumped inside the 7" casing string from 1950' to 1900' MD. The plug will continue into the 8-3/4" open hole from 1900' MD to 1550' MD. The estimated volume of cement (+ 20% excess) is 195 cubic ft.
- Cement slurry for plug: Class G, 17 ppg, 0.9912 cu ft./sack
- The Sidetrack KOP is estimated will be at 1550' MD.
- The objective formation for the sidetrack hole is the Niobrara formation, which is the same objective formation as the wellbore being abandoned.
- The PBHL of the sidetrack hole is the same as the wellbore being abandoned.

Description

1	Drilling/Completion Operations	HighPoint will adhere to the COGCC Policy for Bradenhead Monitoring effective 5/29/12.
2	Drilling/Completion Operations	One of the first wells drilled on the pad will be logged with open-hole Resistivity Log and Gamma Ray Log from the kick-off point into the surface casing. All wells on the pad will have a cement bond log with gamma-ray run on production casing (or on intermediate casing if production liner is run) into the surface casing. The horizontal portion of every well will be logged with a measured-while-drilling gamma-ray log. The Form 5, Completion Report, for each well on the pad will list all logs run and have those logs attached. The Form 5 for a well without open-hole logs shall clearly state "No open-hole logs were run" and shall clearly identify (by API#, well name & number) the well in which open-hole logs were run.
