Subject: Supplemental F27 #401727575

Mike,

I have returned Document #401727575 to draft so that you can provide additional information.

With the information that has been attached to the SF27 it appears that a sample of the "landfarm" material was taken on 8/7/15 that came back with exceedances of EC, SAR, As, and DRO. Another sample on 9/1/15, also of the "landfarm" material was only analyzed for DRO. What was done with the landfarm material?

The east wall sample taken on 7/21/15 contained exceedances of DRO and benzo(A)pyrene. A follow up sample on the east wall taken on 7/27/15 was only analyzed for DRO and GRO. With the information submitted, it seems that there is Benzo(A)pyrene concentration level above Table 910-1.

Let me know if you have any questions.

Thanks,

Jim Hughes
