

A photograph of a soil profile, likely from an excavation or a road cut. The soil is light brown and appears to be composed of sand and silt. A distinct, darker, and more cohesive layer is visible in the center of the profile, which is identified as a hydrocarbon-stained soil layer. Below this layer, there is a pool of water, indicating the presence of groundwater. The water is dark and reflects the surrounding environment. The overall scene is a cross-section of the ground, showing the different layers and the contamination.
