Description of Corrosion Protection

The potential for internal corrosion in the piping is addressed by sweeping any liquids, mainly water, out of the pipe by pigging the line twice monthly. External corrosion potential is addressed by ensuring that all buried lines have external coating, with shrink sleeves installed on larger pipe bare joints, and taped joints on smaller pipe. All external pipe coating is tested "jeeped" prior to being installed in ditch. Galvanic Anodes are frequently installed with buried piping, and flange isolation kits are strategically used where necessary, to optimize effectiveness of cathodic protection.

Description of Integrity Management Program

BCEOC has a Flowline Integrity Management Plan in place, dated April 2016. Bonanza Creek is in the process of updating this plan to ensure compliance with the COGCC 1100 series flowline rules.

Description of the construction method used for public by-ways, road crossings, sensitive wildlife habitats, sensitive areas, and natural and manmade watercourses (i.e., open trench, bored and cased, or bored only), if applicable.

Public by ways: The Flowline is not near any known and defined public receptors. Road crossings: The Flowline does not cross county roads. Typically county permits are acquired prior to construction of county road crossings. Permit conditions may contain minimum construction requirements. Sensitive wildlife habitats: The Flowline is not installed near any known sensitive wildlife habitats.
