#### COMMENTS:

The sundry approved 7/20/2020 for a blowdown mitigation strategy (DOC#: 402368899) stated an approximate start date of 2/26/2020 with six months of consecutive blowdowns approved. Extraction began blowdowns 5/2/2020 and closed out the blowdown mitigation strategy with the Form 17 dated 9/8/2020. Attached are the results of the blowdown mitigation strategy. The blowdown mitigation strategy was unable to successfully mitigate the bradenhead pressure below 50psi. Extraction requests until 9/30/2020 to determine and submit the necessary paperwork for an alternate mitigation strategy.

Pressure and flow rate data were collected during the blowdown process and showed a flowrate of 35.83 MSCF/D and a volume of 0.792 MSCF. Additionally, a bradenhead and production gas sample were taken for comparison. The bradenhead gas sample is 79.79 MOL % Methane. Further analysis shows that the bradenhead gas sample is thermogenic in origin. When compared to the production gas sample taken the bradenhead gas sample is not as thermally mature as the production gas sample taken from the J-Sand-Niobrara-Codell completed intervals. This indicates the bradenhead gas is sourced from a shallower formation in the well.
