# REMEDIAL ACTION PLAN

## SOURCE REMOVAL SUMMARY

Describe how source is to be removed.

Pending results of site investigation.

## REMEDICATION SUMMARY

Describe how remediation of existing impacts to soil and groundwater is to be accomplished (i.e. summarize remedial action plan). Provide a brief narrative description including: technical justification, schedule for implementation, estimated time to attain NFA status, plus plans and specifications for the selected remedial action technology.

Remediation activities for substantial impacts, if required, will likely involve excavation of impaired soils for transport to an approved disposal facility. Following excavation and removal of any impaired soils, confirmation sampling will be conducted to confirm successful remediation. Excavated areas will then be backfilled with clean soil as necessary and seeding of the remediated area to re-establish a proper seedbed. Remediation activities for minor impacts may include in situ treatment methods to reduce contaminants of concern below regulatory limits and to foster successful reclamation. In situ treatment may include scarification of the soil and addition of amendments to breakdown hydrocarbons or modify soil geochemistry to mitigate brine-related impacts which result in increased EC and SAR. Amendments may include manure, straw, specialty hydrocarbon remediation products (e.g., MicroBlaze, DualZorb, etc.), gypsum, or fertilizers. Application rates would be based on need to treat the affected area. Following in situ treatment (usually at least 6 months), confirmation sampling will be conducted to confirm successful remediation.

Plugging and abandonment of the well will include removal of the following equipment from the well site: pumping unit and motor, cathodic protection rectifier. The buried electric line and an off-location flowline will be severed from the well prior to plugging. A Form 44 will be filed for abandonment of the flowline following the plugging operations.
