General Comment:MIRU/After Frac/Flowback Inspection

Per operator 2 wells were flowing back, one well was being drilled out and one well was waiting to be drilled out. Ideal had two flowback set ups, one for the rig and one for the wells. This company was asked for the combustors gas burning efficiency but this was not known and when the combustor was checked for a pilot light and/or switch lights. The pilot light was not on and many connection pieces were laying in a pile at the base of the combustor. Verifcy combustor efficiency and operation with COGCC Engineer.

Production side of pad was under construction. Stained soil pile fenced and location south of production side of pad.

Work was in process to maintain ditches/slopes for water erosion from the fire (see attached photos). Straw is used as mulch and needs better crimping to prevent it from blowing as observed on location.
