COMMENTS:

At the request of Aaron Katz this updated has been submitted. Rangely producer, SW McLaughlin 4 (API # 05-103-01076) had a bradenhead test conducted in August that showed that the well had continuous gas flow and would not blow down to 0 psi (form 17 attached). We conducted diagnostics testing and based off the gas analysis received 9/16/21, we believe the well has a casing leak. Form 43's for both the production casing and bradenhead gas samples have been submitted (DOC #402813668 & # 402813670). Initially, the well was shut-in, but the production casing and bradenhead pressure both built to over 850 psi. As we finished discussing on 11/15/2021, the safest path forward would be to turn the well back on production and allow the wellbore pressure to be reduced. The well was returned to production on 11/13/2021, and as of 11/15/2021, the bradenhead pressure and production casing are both at 70 psi. As we discussed, this well will ultimately be repaired by Scout Energy, so please record this note in the well's file. The well will be rigged up on by 3/16/2022 and the casing integrity will be tested, the leaking interval will be identified and an appropriate repair will be made. The casing will be tested again. After a successful casing integrity test, a subsequent form 17 bradenhead test will be completed. Please let me know if you have any questions.
