COMMENTS:

When pressure testing casing on 11/21/21, the pressure began falling sharply from the high of 11,830psi on the 5.5" Production string. While investigating the source of the pressure loss (possibly surface equipment) the bradenhead pressure began climbing rapidly to 1700 psi. The bradenhead was opened to verify legitimacy of the transducer reading, and the pressure on both the bradenhead and the 5.5" casing was immediately bled off. A workover rig was brought in on 11/24 and the breach was isolated via a tension packer between 1,603' and 1,634'. The well is currently static with positive isolation between the wellbore and oil bearing formations.

The current plan is to run a caliper log to identify the mode of failure of the casing on 11/29, and run a Mohawk Expandable Internal Casing Patch across the affected area, and re-test casing after the repair is made.
