Describe what is known about the spill/release event (what happened -- including how it was stopped, contained, and recovered):

A compromised above ground storage tank resulted in the release of approximately 88 barrels of produced water within lined secondary containment. The release was completely contained in lined secondary containment. A hydro-vacuum was utilized to remove approximately 75 barrels of the released produced water. Additional remediation efforts will occur during warmer weather to recover all released fluid. The storage tank has been drained and removed from service for repairs and investigation into root cause of the failure. Photographic evidence will be provided demonstrating the removal of the released fluids and the condition of the liner following remediation efforts.
