<b>Spills:</b>			
Type	Area	Volume	
Produced Water	WELLHEAD	<= 1 bbl	
Comment:	Inspector observed stained soil at well site. Staining appears to be a thin layer located at the surface as areas that dried and cracked appear to have no staining below the visible surface. Observed staining pattern appears to possibly be emanating from casing flowline T connection from below grade. There are two triangle like patterns visible, one to the south of the T connection and one to the west of the T connection. From the T connection to the south staining is approximately 18 feet in length, 12-18 inches at the T connection, and widening to 8-9 feet at the base. To the west of the T connection staining is approximately 8-9 feet in length, 18 – 30 inches at the top, and 4-5 feet at the base. See Inspection Photo Log.		
Corrective Action:	Control and contain spills/releases and clean up per Rule 912.a. Corrective action date adjusted to reflect FIR submission date due to computer and software issues.		Date: 08/16/2023
In Containment: No			
Comment:	Heavy soaking rains associated with the on going weather pattern may have contributed to collection of organic material and algae growth in standing water. The observed relationship between wet/damp soil and casing flowline dictates investigation to ensure flowline integrity.
