25. Signature	Name (Printed/Typed)	Date
Title		
Approved by (Signature)	Name (Printed/Typed)	Date
Title		Office

Application approval does not warrant or certify that the applicant holds legal or equitable title to those rights in the subject lease which would entitle the applicant to conduct operations thereon.
Conditions of approval, if any, are attached.

Title 18 U.S.C. Section 1001 and Title 43 U.S.C. Section 1212, make it a crime for any person knowingly and willfully to make to any department or agency of the United States any false, fictitious or fraudulent statements or representations as to any matter within its jurisdiction.

INSTRUCTIONS

GENERAL: This form is designed for submitting proposals to perform certain well operations, as indicated on Federal and Indian lands and leases for action by appropriate Federal agencies, pursuant to applicable Federal laws and regulations. Any necessary special instructions concerning the use of this form and the number of copies to be submitted, particularly with regard to local, area, or regional procedures and practices, either are shown below or will be issued by, or may be obtained from local Federal offices.

ITEM I: If the proposal is to redrill to the same reservoir at a different subsurface location or to a new reservoir, use this form with appropriate notations. Consult applicable Federal regulations concerning subsequent work proposals or reports on the well.

ITEM 4: Locations on Federal or Indian land should be described in accordance with Federal requirements. Consult local Federal offices for specific instructions.

ITEM 14: Needed only when location of well cannot readily be found by road from the land or lease description. A plat, or plats, separate or on the reverse side, showing the roads to, and the surveyed location of, the well, and any other required information, should be furnished when required by Federal agency offices.

ITEMS 15 AND 18: If well is to be, or has been directionally drilled, give distances for subsurface location of hole in any present or objective productive zone.

ITEM 22: Consult applicable Federal regulations, or appropriate officials, concerning approval of the proposal before operations are started.

ITEM 24: If the proposal will involve hydraulic fracturing operations, you must comply with 43 CFR 3162.3-3, including providing information about the protection of usable water. Operators should provide the best available information about all formations containing water and their depths. This information could include data and interpretation of resistivity logs run on nearby wells. Information may also be obtained from state or tribal regulatory agencies and from local BLM offices.

NOTICES

The Privacy Act of 1974 and regulation in 43 CFR 2.48(d) provide that you be furnished the following information in connection with information required by this application.

AUTHORITY: 30 U.S.C. 181 et seq., 25 U.S.C. 396; 43 CFR 3160

PRINCIPAL PURPOSES: The information will be used to: (1) process and evaluate your application for a permit to drill a new oil, gas, or service well or to reenter a plugged and abandoned well; and (2) document, for administrative use, information for the management, disposal and use of National Resource Lands and resources including (a) analyzing your proposal to discover and extract the Federal or Indian resources encountered; (b) reviewing procedures and equipment and the projected impact on the land involved; and (c) evaluating the effects of the proposed operation on the surface and subsurface water and other environmental impacts.

ROUTINE USE: Information from the record and/or the record will be transferred to appropriate Federal, State, and local or foreign agencies, when relevant to civil, criminal or regulatory investigations or prosecution, in connection with congressional inquiries and for regulatory responsibilities.

EFFECT OF NOT PROVIDING INFORMATION: Filing of this application and disclosure of the information is mandatory only if you elect to initiate a drilling or reentry operation on an oil and gas lease.

The Paperwork Reduction Act of 1995 requires us to inform you that:

The BLM connects this information to a new evaluation of the technical, safety, and environmental factors involved with drilling for oil and/or gas on Federal and Indian oil and gas leases. This information will be used to analyze and approve applications. Response to this request is mandatory only if the operator elects to initiate drilling or reentry operations on an oil and gas lease. The BLM would like you to know that you do not have to respond to this or any other Federal agency-sponsored information collection unless it displays a currently valid OMB control number.

BURDEN HOURS STATEMENT: Public reporting burden for this form is estimated to average 8 hours per response, including the time for reviewing instructions, gathering and maintaining data, and completing and reviewing the form. Direct comments regarding the burden estimate or any other aspect of this form to U.S. Department of the Interior, Bureau of Land Management (1004-0137), Bureau Information Connection Clearance Officer (WO-630), 1849 C Street, N.W., Mail Stop 401 LS, Washington, D.C. 20240.

Review and Appeal Rights

A person contesting a decision shall request a State Director review. This request must be filed within 20 working days of receipt of the Notice with the appropriate State Director (see 43 CFR 3165.3). The State Director review decision may be appealed to the Interior Board of Land Appeals, 801 North Quincy Street, Suite 300, Arlington, VA 22203 (see 43 CFR 3165.4). Contact the above listed Bureau of Land Management office for further information.

CONFIDENTIAL

Conditions of Approval - Surface

Well Name:	Southern Ute 703H & 705H Proposed Natural Gas Wells
Lease Number:	14201516
Location:	Sections 15, T. 32 N., R. 7 W. La Plata County, Colorado
Operator:	Hilcorp Energy Company
Application:	Application for Permit to Drill (APD)

The following mitigation measures were derived from the Southern Ute 701H, 702H, 703H, & 705H Proposed Natural Gas Wells, Well Pads, and Pipelines EA (DOI-BLM-CO-S010-2017-0016-EA) and will be attached to the Applications for Permit to Drill as Conditions of Approval and only apply to the Federal action.

Air Quality

1. The operator shall prevent and abate fugitive dust as needed, whether created by vehicular traffic, equipment operations, or wind events. Well pad and roads must be surfaced or dust inhibitors must be used (eg. surfacing materials, non-saline dust suppressants, water, etc.), as appropriate, on roads and wells locations constructed on soils susceptible to wind erosion to reduce the amount of fugitive dust generated by traffic of other activities.
2. During construction activities or heavy vehicle traffic during drilling and completion operations, the operator shall apply freshwater to travel paths/roads twice daily, unless soil conditions do not warrant water application or written approval is acquired for application of surfactants.
3. Vehicle speed shall not exceed 20 miles per hour on the access roads. No matter the speed of the vehicle, when travel on roads results in dust plumes that exceed the height of the vehicle, travel speeds shall be reduced.
4. Utilize green completions for the completion operations for the wells. If green completions is not feasible, route all natural gas produced during well completion to a combustion device. No natural gas produced during completions can be vented to the atmosphere.
5. All new and replacement internal combustion gas field engines must meet New Source Performance Standards (NSPS) (40 CFR 60, Subpart JJJJ). Additionally, all new and replacement internal combustion gas field engines greater than or equal to 500 design-rate horsepower (*or site de-rated horsepower values, as long as manufacturer de-ration values and emission factors are supplied and current demonstration compliant with appropriate emission rate requirement*) must not emit more than 1 gram of NO_x per horsepower-hour.

6. All prime mover diesel drilling rig engines must meet Tier 2 (or better) emission standards.
7. Operator must comply with all applicable sections of New Source Performance Standards OOOO and OOOOa for gas well affected facilities during well completion activities.
8. An Oil and Gas Facility Air Quality Monitoring Annual Report must be submitted to the SUT Air Quality Program by April 1st of each year. The reporting form can be found on the SUT DOEs website at the following link: <https://www.suitdoe.com/wp-content/uploads/sites/9/2018/04/AirQualityReportForm1.pdf>

Federally Protected Species and Habitat

9. The operator must equip and maintain all open-vent exhaust stacks on production equipment to prevent birds from entering, and to discourage perching, roosting, and nesting. (Recommended enclosure structures on open-vent exhaust stacks are in the shape of a cone.)
10. The operator must install and maintain enclosure fencing for all open well cellars to prevent access to wildlife before and after drilling operations until the cellar is backfilled or covered/screened properly.
11. The operator must install and maintain a rigid screen over all open-topped tanks holding production fluid to prevent wildlife entry.

Noise

12. Noise generated from the production equipment must be oriented in such a way to direct the least amount of noise toward nearby residents.

Water Resources – Ground Water

13. The operator shall install storage tanks with a secondary containment structure of sufficient capacity to contain at least 110% of the storage capacity of the largest storage tank. The operator shall prevent livestock from entering the secondary containment area by installing an enclosure fence.
14. Chemical containers shall be clearly labeled, maintained in good condition, and placed within a secondary containment structure. Small secondary containment basins must be screened to prevent wildlife entry.
15. Below-grade tanks must be equipped with an appropriate leak detection system. The walls and floors must be double-walled if the tank comes into contact with soil.
16. In the event that domestic ground water well degradation is caused by a gas well, the gas well must be remediated or other action taken as determined by the appropriate agency.

HILCORP ENERGY COMPANY
SOUTHERN UTE 703H

GENERAL REQUIREMENTS FOR OIL AND GAS OPERATIONS ON FEDERAL AND INDIAN LEASES

I. GENERAL

- A. Prior approval by the BLM-Authorized Office (Drilling and Production Section) is required for variance from the approved drilling program and before commencing plugging operations, plug back work casing repair work, corrective cementing operations, or suspending drilling operations indefinitely. Emergency approval may be obtained orally, but such approval is contingent upon filing of a notice of intent (on a Sundry Notice, Form 3160-5) within three business days (original and three copies of Federal leases and an original and four copies on Indian leases). **Any changes to the approved plan or any questions regarding drilling operations should be directed to BLM during regular business hours via Sundry Notice. Emergency program changes after hours should be directed to Joe Killins at (970) 759-8988.**
- B. Notify this office at least 24 hours in advance prior to the following:
- a. Well Spud
 - b. Running and cementing casing
 - i. Submit a cement evaluation log if cement is not circulated to surface.
 - c. BOP test
 - i. In the event a BLM inspector is not present during the initial BOP test, please provide chart record.
- C. Each well shall have a well sign in legible condition from spud date to final abandonment. The sign should show the operator's name, lease serial number, or unit name, well number, location of the well, and whether lease is Tribal or Allotted, (See 43 CFR 3162.6(b)).
- D. A complete copy of the approved Application for Permit to Drill, along with any conditions of approval, shall be available to authorized personnel at the drill site whenever active drilling operations are under way. All operations will be governed by Onshore Order #2 unless specifically modified prior to operations.

INTERIOR REGION 7 • UPPER COLORADO BASIN

COLORADO, NEW MEXICO, UTAH, WYOMING

- E. From the time drilling operations are initiated and until drilling operations are completed, a member of the drilling crew or the tool pusher shall always maintain rig surveillance, unless the well is secured with blowout preventers or cement plugs.
- F. On directional/horizontal wells submit as drilled directional survey from surface to total depth.

II. Site Specific

III. PHONE NUMBERS

Rodney Brasher	Lead Technician	work: 970-385-1347	cell: 970-799-1244
Alan White	Technician	work: 970-385-1201	cell: 970-317-0329
Nathan Willis	Technician	work: 970-385-1349	cell: 970-749-1734
Bryan Clappe	Technician	work: 970-385-1364	cell: 970-903-9077
Joe Killins	Engineer	work: 970-385-1363	cell: 970-759-8988

NOTICE TO OPERATORS

All Spud notifications must be given to BLM personnel directly. **Do not leave messages on answering machines.** Spud notices are to be phoned into the BLM office during regular working hours (Monday-Friday, 8:00-4:30).

If any operations are to start over the weekend or holiday, notify this office by **noon** Friday or the day prior to the holiday. If any problems arise after hours or on weekends, call BLM personnel using the home phone numbers listed below. **Do not leave messages on answering machines.**

Rodney Brashear	Lead Technician	work: 970-385-1347	cell: 970-799-1244
Alan White	Technician	work: 970-385-1201	cell: 970-317-0329
Nathan Willis	Technician	work: 970-385-1349	cell: 970-749-1734
Bryan Clappe	Technician	work: 970-385-1364	cell: 970-903-9077
Joe Killins	Petroleum Engineer	work: 970-385-1363	cell: 970-759-8988

PLEASE NOTE:

1. Approved for a period not to exceed 2 years.
2. Approval of this agreement does not warrant or certify that the operator thereof and other holders of operating rights hold legal or equitable title to those rights in the subject lease which are committed hereto.
3. See Site Specific Conditions of Approval.

INFORMATIONAL NOTICE - APDs

Tres Rios Field Office

This notice is an abstract of some major regulations and Onshore Orders and includes notification requirements and information.

1. Drilling Operations (Onshore Order No. 2)
 - a. If DSTs are run, all applicable safety precautions outlined in Onshore Order No. 2 shall be observed.
 - b. All indications of usable water (10,000 ppm or less TDS) shall be reported to the Tres Rios Field Office prior to running the next string of casing or before plugging orders are requested, whichever occurs first.
2. Well Abandonment (43 CFR 3162.3-4, Onshore Order No. 1-Sec.V)

Approval for abandonment shall be obtained prior to beginning plugging operations. Initial approval for plugging operations may be verbal, but shall be followed-up in writing within 30 days. Subsequent and final abandonment notifications are required and shall be submitted on Sundry Notice (Form 3160-5), in triplicate.

3. Reports and Notifications (43 CFR 3162.3-2, 3162.4-1, 3162.4-3, 00-6)
 - a. Within 30 days of completion of the well as a dry hole or producer, a copy of all logs, core descriptions, core analyses, well-test data, geologic summaries, sample descriptions or data obtained and compiled during the drilling, work over, and/or completion operations shall be filed with a Completion Report (Form 3160-4), in triplicate. Submit casing/cementing reports and other subsequent reports via Sundry Notice, Form 3160-5.
 - b. In accordance with 43 CFR 3162.4-3, this well shall be reported on BLM Form 3160-6, Monthly Report of Operations, starting with the month in which drilling operations commence, and continuing each month until the well is physically plugged and abandoned.
 - c. Notify this office within 5 business days of production start-up if either of the following two conditions occur:
 - (1) The well is placed on production, or
 - (2) The well resumes production after being off production for more than 90 days.

Placed on production means shipment or sales of hydrocarbons from temporary tanks, production into permanent facilities or measurement through permanent facilities. Notification may be written or verbal with written follow-up within 15 days.

- d. As per Onshore Order No. 6, III.A.2.b., if hydrogen sulfide is present the operator shall initially test the H₂S concentration of the gas stream for each well or production facility. Submit the results of this test within 30 days of filing Form 3160-4, Well Completion or Recompletion Report and Log.
4. Environmental obligations and disposition of production (00-7, NTL-3A, 43 CFR 3162.5-1, 3162.7 and 40 CFR 302-4)

If underground injection is proposed, an EPA or State UIC permit shall also be required and submitted to this office.

 - a. Spills, accidents, fires, injuries, blowout and other undesirable events shall be reported to this office within the time frames in NTL-3A.

- b. Venting and flaring of gas during drilling, completion, initial production testing, subsequent well operations and emergencies are governed by 43CFR 3179.1
- c. Off-lease measurement and commingling of production must be approved by the authorized officer.

5. Well Identification (43 CFR 3162.6)

Each drilling, producing or abandoned well on Tribal Or Federal lands shall be identified as follows. All signs will be legible and in a conspicuous place.

Drilling wells shall have items 1-4

Producing and abandon wells shall have items 1-6

The well sign for the reference well must include:

1. Name of the operator
2. API Number
3. SL (surface location – QtrQtr), Township and Range
4. SL lease number
5. BHL (bottom hole location Qtr Qtr-end of lateral if appropriate), Township and Range
6. BHL lease number or Communitization Agreement Number (if applicable) and whether lease is Tribal or Allotted.

6. Bureau of Land Management, Tres Rios Field Office Address and Contacts:

10	High Closing Ratio Valve	21	Manual Isolation Valve
11	3M Blind Rams	22	Manual Isolation Valve

Technical Drilling Plan (Rev. 05)

Hilcorp Energy Company proposes to drill and complete the referenced dual lateral horizontal well targeting a coal seam in the Fruitland formation.

Note: This technical drilling plan will be adjusted based upon actual conditions.

1. Location

Date:	April 18, 2023	Pool:	Fruitland Coal
Well Name:	Southern Ute 703H	Ground Elevation (ft. MSL):	6,259'
Surface Hole Location:	37.02382° N, 107.587744° W	County, State:	La Plata County, CO
Lateral #1 Depth (ft.)	7,277' MD / 2,922' TVD	Lat 1 Bottom Hole Location:	37.019° N, 107.602° W
Lateral #2 Depth (ft.)	6,808' MD / 2,915' TVD	Lat 2 Bottom Hole Location:	37.022° N, 107.602° W

Note: All depths in the directional drilling plan are referenced from an estimated RKB datum of 15' above ground level.

2. Geological Markers

Anticipated formation tops with comments of any possible water, gas or oil shows are indicated below:

Formation	Depth (ft. TVD)	Remarks
Ojo Alamo	2,318'	Water (fresh/useable)
Kirtland	2,456'	None
Fruitland	2,540'	Gas, Coal, Water

3. Pressure Control Equipment

See attached BOP equipment and choke manifold schematics for a diagram of pressure control equipment.

- BOP equipment will be nipped up on top of the wellhead after surface casing is set and cemented.
- Pressure control configurations will be designed to meet the minimum 2M standards.
- All equipment will have a minimum of 3M pressure rating and will be rated for 5,000' (TVD).
- A rotating head will be installed on top of the annular as seen in the attached diagram.

4. Casing & Cement Program

A. Proposed Casing Program:

Proposed Casing Design					
Casing String	Hole Size	Casing Size	Weight/Grade	Top Depth (MD/TVD)	Shoe Depth (MD/TVD)
Surface	12-1/4"	9-5/8"	32.3# H40 (or equiv.) STC	0'	300' / 300'
Intermediate	8-3/4"	7"	23# J55 (or equiv.) LTC	0'	3,476' / 2,968'
Lateral #1 Production Liner (pre-perforated)	6-1/4"	4-1/2"	11.6# J55 (or equiv.) LTC	3,200' / 2,851'	7,277' / 2,922'
Lateral #2 Production Liner (pre-perforated)	6-1/4"	4-1/2"	11.6# J55 (or equiv.) LTC	3,145' / 2,827'	6,808' / 2,915'
Proposed Casing Design Safety Factors					
Casing String	Casing Description	Burst Design SF	Collapse Design SF	Joint Tensile Design SF	Connection Tensile Design SF
Surface	9-5/8" 32.3# H40 STC	15.8	18.1	37.7	26.2
Intermediate	7" 23# J55 LTC	2.9	4.1	4.6	3.9
Lateral #1 Production Liner (pre-perforated)	4-1/2" 11.6# J55 LTC	N/A	N/A	2.2	1.9
Lateral #2 Production Liner (pre-perforated)	4-1/2" 11.6# J55 LTC	N/A	N/A	2.2	1.9

Notes:

- The production liners will be pre-perforated and dropped off in the open hole (uncemented). The top of the production liner will be approximately 5'-10' outside of the casing exit (no overlap between liner and 7" casing).
- If the 6-1/4" hole is not drilled to the total planned measured depth, the production liner setting depth and length will be adjusted accordingly.
- The 7" casing will be set across the setback boundary line and with the casing shoe within the drill block.

B. Proposed Centralizer Program:

Proposed Centralizer Program	
Interval	Centralizers & Placement
Surface	1 centralizer per joint on bottom 3 joints.
Intermediate	1 centralizer 10' above the shoe with lock collar. 1 centralizer every other joint on bottom 10 joints. 1 centralizer every 4 th joint to Ojo Alamo base. 1 Turbolizer at base of Ojo Alamo. 1 centralizer every joint to Ojo Alamo top. 1 Turbolizer placed midway through Ojo Alamo. 1 centralizer every 4 th joint from top of Ojo Alamo to surface shoe. 1 centralizer inside the surface casing.
Production	N/A

5. Drilling Fluids Program

A. Proposed Drilling Fluids Program:

Interval	Fluid Type	Density (ppg)	Fluid Loss (mL/30 min)	Max Chlorides (mg/L)	Depth (ft. MD)
Surface	Spud Mud	8.3 – 9.2	NC	1,000	0' – 300'
Intermediate	LSND / Gel System	8.4 – 9.5	6-16	1,000	300' – 3,443'
Production Lateral #1	LSND Brine (if needed)	8.5 – 10.5	4-14	1,000 400,000 (if CaCl added for density)	3,189' – 7,277'
Production Lateral #2	LSND Brine (if needed)	8.5 – 10.5	4-14	1,000 400,000 (if CaCl added for density)	3,140' – 6,808'

Notes:

- In the 6-1/4" production section, CaCl brine will only be utilized if a weighting agent is needed to increase mud weight (for either well control or wellbore stability).
- Lost circulation material may be added to the mud systems to manage fluid losses as hole conditions dictate.
- The well will be drilled utilizing a closed-loop circulating system. Drill cuttings will be transported to an approved disposal site.
- Estimated total volume of drill cuttings for disposal: 659 bbls (3,700 ft³).

6. Estimated Pressures & Drilling Hazards

A. Estimated Pressures

- Estimated Reservoir Pressure of Fruitland Coal: 600 – 900 psi
- Maximum Anticipated Surface Pressure: 700 psi
- No over-pressured intervals expected.
- There is production from the Fruitland Coal formation in offset wells in the area, which could result in these formations being under-pressured.

B. Water Flows

- Water flows are possible in the intermediate section. Water flows will be mitigated with increased mud weight.

C. Lost Circulation

- Lost circulation is possible in the coal section. Losses will be mitigated by adding LCM to the mud system.

D. Hydrogen Sulfide

- No hydrogen sulfide is expected to be encountered based on nearby well production.

7. Testing, Logging, Coring

A. Mud Logging

- Mud loggers will collect formation samples every 30' from the surface casing shoe to both the TD of the pilot hole and TD of the production laterals.

B. MWD

- Measurement while drilling tools will be utilized from the surface casing shoe to both the TD of the pilot hole and TD of the production laterals to measure and record inclination and azimuth.

C. LWD

- Logging while drilling tools (gamma ray) will be utilized in the intermediate section from the surface casing shoe to the pilot hole section TD.
- Logging while drilling tools (gamma ray) will be utilized while drilling the production laterals from the intermediate casing kick-offs to the production laterals' TD to assist in staying in the desired coal seam while drilling the lateral sections.

D. Open Hole Logging

- There are no planned open hole logs post drilling.

E. Coring

- There is no coring or formation testing planned.

F. Cased Hole Logging

- The 7" intermediate casing will be cemented to surface to protect water bearing zones. If cement is not circulated to surface on the intermediate cement job, a temperature survey or a cement bod log will be run to verify top of cement.

8. Directional Drilling Plan

- The directional drilling plans and plots are attached.
- The directional plan is built from geologic targets from offset wells and lease boundaries. The production laterals will be landed and drilled horizontally within the target formation utilizing LWD tools to steer the wellbores. On-site adjustments to the directional plans will be made as formation and wellbore dictate.

C. Proposed Cement Program:

Proposed Cement Design							
Interval	Depth (ft. MD)	Lead/Tail	Volume (ft ³)	Sacks	Slurry	Density	Planned TOC
Surface	300'	Lead	188 ft ³	151	Type III Cement 0.25% FL-52, 0.25 pps celloflake 1.25 ft ³ /sk – 5.75 gal/sk	15.2 ppg	Surface
Intermediate	3,476'	Lead	768 ft ³	361	Premium Lite 3% CaCl, 0.25 pps celloflake, 5 ppm LCM-1, 0.4% FL-52, 8% bentonite, 0.4% SMS 2.13 ft ³ /sk – 11.29 gal/sk	12.1 ppg	Surface
		Tail	90 ft ³	65	Type III Cement 1% CaCl, 0.25 pps celloflake, 0.2% FL-52 1.38ft ³ /sk – 6.64 gal/sk	14.6 ppg	2,976'
Production Lateral #1	7,277'	N/A	N/A	N/A	N/A – Uncemented pre-perforated liner.	N/A	N/A
Production Lateral #2	6,808'	N/A	N/A	N/A	N/A – Uncemented pre-perforated liner.	N/A	N/A

Notes:

- The cement slurry additives may be adjusted to accommodate required pump and compressive test times.
- For the intermediate hole section, a 2-stage cement job may be performed if hole conditions dictate. If needed, the stage tool will be placed at an approximate depth near the top of the Fruitland Coal (2,540' TVD)
- Cement will be circulated to surface on surface and intermediate casing sections to protect water bearing zones.
- A minimum of 8 hours of wait on cement time will be observed on each hole section to allow adequate time for cement to achieve a minimum of 500 psi of compressive strength. The BOP will not be nipped down, the wellhead will not be installed, the casing will not be tested and the prior casing shoe will not be drilled out until adequate wait on cement time has been observed (8 hours or time to reach 500 psi compressive strength).

SHEET B3

Hilcorp

Road Maintenance Plan

The following Road Maintenance Plan will be implemented and followed by Hilcorp Energy Company (Hilcorp) for roads utilized in its San Juan Basin Operations. All roads will be constructed and maintained to meet Bureau of Land Management (BLM) Gold Book Standards, BLM Manuals 9113-1 (Roads Design Handbook), and BLM Manuals 9113-2 (Roads National Inventory and Condition Assessment Guidance and Instructions Handbook).

Road Inspections

1. A Hilcorp representative or designated inspector will conduct regular inspections of all newly constructed, reconstructed, and improved roads used for construction, operation, maintenance, and termination of Hilcorp's oil and gas operations.
2. Inspector will examine roads for proper maintenance of key features including: reduction of ruts and holes, maintenance of crowns and sloped areas related to the roads, condition of surface materials, efficacy of culverts and sediment traps, condition of interim reclamation, and presence of noxious weeds.
3. Road inspections will be conducted within 5 business days of major storm events such as major snow melt or prolonged rain, in order to ensure proper operation of drainage systems, and erosion and sediment control structures and features.
4. Inspectors will examine the roadways and document the inspection using the attached checklist during each inspection.
5. Inspection records will be filed and provided to the BLM upon written request.

Maintenance Procedures

For existing County Roads or roads that are considered collector roads, Hilcorp would defer to the county or to the Roads Committee, when formed, for maintenance determinations.

Roads would be maintained to the same or better condition as existed prior to the commencement of operations. Maintenance would continue until final abandonment and reclamation of Hilcorp's related oil and gas operation.

Best management practices (BMPs) for dust abatement and erosion control would be utilized along the roads to reduce fugitive dust on as needed basis. Water application using a rear-spraying truck or other suitable means would be the primary method of dust suppression along the roads.

No routine maintenance activities would be performed during periods when the soil is too wet to adequately support construction equipment. If equipment creates ruts deeper than 6 inches, the soil would be deemed too wet for construction or maintenance.

In addition to regular maintenance, road inspection would be used to identify any additional maintenance needs.

Road and Drainage Structures and Features

1. Road Crown

Maintenance of road crowns will be conducted to rectify ruts, holes, and rough areas and ensure adequate drainage on road features and outlopes. Needed maintenance will be conducted using a maintainer to re-grade and/or resurface the road crown.

2. Culverts

Culverts and silt trap maintenance and/or repair will be conducted on as-needed basis, using hand tools or machinery such as a back hoe. Excavation and debris removal activities will be conducted in accordance to the requirements of the surface management agency and conducted with compliance to applicable Clean Water Act-Best Management Practices, and applicable requirements for passage for aquatic species. If the culvert is damaged by having its inlet or outlet crushed, it would be replaced.

3. Ditches

Road side ditches will be maintained to ensure proper function, on as-needed basis, using maintainer or the appropriate equipment to clear and/or blade as necessary. Maintenance activities will be implemented with consideration of resource objective for soil, water, and visual quality as is feasible with relation to maintenance costs.

4. Silt Traps and Water Control Structures

Silt traps and water control structures will be maintained to ensure proper function, on as-needed basis using maintainer or the appropriate equipment to clear, excavate, and/or blade as necessary. Sediment removed from silt traps and water control structures would be disposed at an approved facility or utilized for construction activities with the approval of the surface management agency.

5. Replacement of Road Surface Material

Road surface material will be maintained and supplemented/replaced on as-needed basis, using the appropriate substrate from an approved source, in order to maintain proper road operation and condition.

6. Maintenance of Interim Reclamation

Disturbance related to maintenance activities will be subject to interim reclamation and stabilizations standards and guidelines, in order to meet objectives outlined in the reclamation plan, as pertaining to projects on case-by-case basis.

7. Noxious Weeds

Should any noxious or invasive weeds be documented during the inspection and/or maintenance activities, the BLM/FFO weed coordinator will provide Hilcorp with specific requirements and instructions for weed treatments, including the period of treatment, list of approved herbicides, required documentation to be submitted to the BLM/FFO after treatment, and any other site-specific instructions that may be applicable.

I. BACKGROUND

Applicant:	Hilcorp San Juan, L.P.
Project Type:	Horizontal Oil & Gas Well Project
Project Name:	Southern Ute 703H
Legal Location:	E/2 of Section 15 and the E/2 of Section 22, Township 32 North, Range 7 West, New Mexico Principle Meridian (NMPM), in La Plata County, Colorado.

Introduction

This reclamation plan has been prepared based on requirements and guidelines of the Bureau of Land Management (BLM) Tres Rios Field Office, and Onshore Oil and Gas Order No. 1.

The Burlington contact person for this Reclamation Plan is:

Bobby Spearman
Construction Foreman
505-324-5112
bspearman@hilcorp.com

Plans for Surface Reclamation

According to Onshore Oil and Gas Order No. 1 under the authority of the Code of Federal Regulations, Title 43: Subpart 3164, the operator must submit a plan for the surface reclamation or stabilization of all disturbed areas. This plan must address interim (during production) reclamation for area of the well pad not needed for production, as well as final abandonment of the well location, facilities or improvements.

Revision of the Reclamation Plan

Burlington may submit a request to the BLM/SUIT to revise the Reclamation Plan at any time during the life of the project in accordance to page 44 of the Gold Book (USDI-USDA 2007). Burlington will include justification for the revision request.

Project Description

The proposed project is located on private lands and on the Southern Ute Indian Reservation (SUIR) in La Plata County, Colorado. This Surface Reclamation Plan will address the portion of the project located on SUIR lands administered by the Southern Ute Indian Tribe and the Bureau of Indian Affairs, Ignacio, Colorado; and the Bureau of Land Management's Tres Rios Field Office, Durango, Colorado.

The proposed well pad, the proposed access road, and approximately 2,436 feet of the proposed subsurface well-tie pipeline would be on private land. The remaining 7,287-foot subsurface pipeline corridor would be located approximately 1.7 miles north of the Colorado-New Mexico State line and 6.8 miles southeast of Ignacio. The pipeline corridor is situated east of Spring Creek near the southeastern base of Indian Mesa in Great Basin Desert scrub habitat.

Estimated Total Area of Disturbance

The entire well pad, including one temporary use area (TUA) and construction buffer area, would be constructed on the Mary S. Austin Estate fee lands within a total permitted area of 2.05 acres. The project would require the construction of a 78.63-foot access road within a 20-foot-wide corridor

which would result in approximately 0.036 acre of new surface disturbance. Once the well has been completed and proves to be viable, Hilcorp would construct a subsurface well-tie pipeline overlapping the proposed well pad area and would not result in new surface disturbance. Total potential new surface disturbance for the development would be approximately 2.086 acres.

The TUA would be reclaimed following construction. Production equipment will be placed on the well pad in such a manner to allow proper safe access to produce and service the well/facilities while minimizing long-term disturbance and maximizing interim reclamation. As practical, access will be provided by a tear-drop shaped road through the production area. The well pad area will be reclaimed to an approved working area.

Pre-Disturbance Site Visit and Site Conditions

This plan is based on observations made during numerous pre-disturbance site visits and compiled from information obtained from consultation with multiple agencies including SUIT, BLM-Tres Rios, and BIA.

Vegetation Community

Based on observations made during pre-disturbance site visits, it has been determined that the vegetation community which best represents the proposed project area is Piñon-Juniper Woodland Community. This community is typically associated with a significant shrub component, notably antelope bitterbrush, mountain-mahogany, rabbitbrush species, sagebrush species, scrub oak, and Utah serviceberry. A mix of warm and cool season grasses are also often present, including blue grama, bottlebrush squirreltail, Indian ricegrass, muttongrass, needle-and-thread grass, prairie junegrass, sand dropseed, and Western wheatgrass. Piñon-Juniper Woodland Community can exhibit shallow, rocky soils (persistent) or deep soils (wooded shrubland).

Proposed Reclamation Seed Mix

Hilcorp will use the Mix #1 reclamation seed mix developed by the SUIT Department of Natural Resources, Range Division, for use on lands around the Los Piños River valley and east of U.S. Highway 550 on the SUIR (see Table 1 below).

Table 1. SUIT Mix #1 Reclamation Seed Mix

Common Name	Scientific Name	Pounds/PLS/acre
Western wheatgrass	<i>Agropyron smithii</i>	7
Antelope bitterbrush	<i>Purshia tridentata</i>	1
Smooth brome	<i>Bromus inermis</i>	4
Intermediate wheatgrass	<i>Thinopyrum intermedium</i>	3
Annual Sterile Ryegrass or Sterile Triticale		12

Vegetation Reclamation Standards

The SUIT Department of Natural Resources, Range Division considers a site adequately reclaimed once 70 percent revegetation has been achieved. Hilcorp will monitor the progress of reclamation along the proposed Southern Ute 703H pipeline with during routine site inspections in conjunction with stormwater management practices at the site. The SUIT will be notified upon attainment of 70 percent revegetation within the pipeline corridor.

Pre-Disturbance Weed Survey

During the pre-disturbance site visit, the proposed action area was surveyed for invasive and/or noxious weeds listed by La Plata County, the State of Colorado, and the SUIT. During the survey, no noxious weeds were documented within the proposed action area.

Pre-Disturbance Site Photographs

Photographs can be found in Appendix C of the Biological Assessment on file with the BLM Tres Rios Field Office or SUIT Department of Natural Resources, Division of Wildlife Resource Management.

II. PLAN FOR SURFACE RESTORATION

Techniques for Successful Revegetation

Vegetation and Site Clearing

Woody vegetation, such as large shrubs and trees, will be cleared from the staked project area and stockpiled for later use as soil mulch, visual mitigation, and/or wildlife shelter.

Surface rocks (where present and useful for reclamation) will be stockpiled adjacent to the topsoil stockpile. During reclamation activities, the surface rock will be placed within the area of reclamation for erosion control or in a manner that visually blends with the adjacent undisturbed area.

Topsoil Stripping, Storage, and Redistribution

If available, the upper 6 inches of topsoil will be stripped, following vegetation and site clearing during construction activities. Hilcorp contractors will take care not to mix topsoil with the underlying subsoil horizons and will stockpile the topsoil separately from subsoil or other excavated material. Topsoil and sub-surface soils will be replaced in the proper order, prior to final seedbed preparation.

Water Management/Erosion Control Features

Hilcorp will use appropriate erosion control/water management design features within the proposed project area. Hilcorp will use straw wattles as appropriate to limit erosion and sediment transport from any stockpiled soils. A completed stormwater management plan is being drafted and will be on file with the SUIT Department of Natural Resources, Water Resources Division.

Seedbed Preparation

Areas to be reclaimed will be re-contoured to blend with the surrounding landscape, emphasizing restoration of existing drainage patterns and landform to pre-construction condition, to the extent practicable.

Seedbed preparation of compacted areas will be ripped to a minimum depth of 12 inches, with a maximum furrow spacing of 2 feet. Where practicable, ripping will be conducted in two passes at perpendicular directions. Disking will be conducted if large clumps or clods remain after ripping. Any tilling or disking that occurs along the contour of the slope and seed drills will also be run along the contour to provide terracing and prevent rapid run-off and erosion. If broadcast seeding is used, a dozer or other tracked equipment will track perpendicular to the slope prior to broadcast seeding.

Following final contouring, the backfilled or ripped surfaces will be covered evenly with stockpiled topsoil. Final seedbed preparation will consist of raking or harrowing the spread topsoil prior to seeding to promote a firm (but not compacted) seedbed without surface crusting. Seedbed preparation may not be necessary for topsoil storage piles or other areas of temporary seeding.

Soil Treatments

It has not been determined at this time if soil amendments will be used during reclamation of the affected environment.

Seeding

Seeding will occur within 90 days following project completion.

A Truax seed drill or modified rangeland drill that allows for seeding species from different seed boxes at different planting depths will be used to seed the disturbed areas of the project area. Hilcorp or its reclamation contractor will ensure that perennial grasses and shrubs are planted at the appropriate depth. Intermediate size seeds (such as wheatgrasses and shrubs) will be planted at a depth of 1 to 2 inches. Small seeds (such as alkali sacaton and sand dropseed) will be planted at a depth of 0.25 inch. In situations where differing planting depths are not practicable using available equipment, the entire seed mix will be planted no deeper than 0.25 inch.

Drill seeding may be used on well-packed and stable soils that occur on gentler slopes and where equipment and drills can safely operate. Where drill seeding is not practicable due to topography, the reclamation contractor will hand-broadcast seed using a "cyclone" hand seeder or similar broadcast seeder. Broadcast application of seed requires a doubling of the drill-seeding rate. The seed will then be raked into the ground so the seed is planted no deeper than 0.25 inch below the surface.

Mulching

Hand seeding with hydro-mulch, excelsior netting, and/or mulch with netting may be required on cut and fill slopes. Mulch should be grass or straw spread at 2,000 to 3,000 pounds per acre, or approximately 1 to 2 inches deep. Mulching will consist of crimping certified weed-free straw or certified weed-free native grass hay into the soil.

Straw or native grass hay mulch can be applied by hand broadcasting or blowing to a relatively uniform depth of 2 to 3 inches, equivalent to a rate of approximately 2 tons per acre (one 74-pound bale per 800 square feet). When applied properly, approximately 20 to 40 percent of the original ground surface will be visible.

Straw or native grass hay mulch will then be anchored using one of the following methods:

- Hand Punching – a spade or shovel is used to punch mulch into the topsoil at 1-foot intervals until all areas have mulch standing perpendicular to the slope and the mulch is embedded at least 4 inches into the soil.
- Roller Punching – a roller is used to spread mulch over an area; the roller is equipped with straight studs not less than 6 inches long, from 4 to 6 inches wide, and approximately 1 inch thick.
- Crimper Punching – similar to roller punching, a crimper is used over the soil. The crimper has serrated disk blades about 4 to 8 inches apart that force the mulch into the soil. Crimping should be done in two directions with the final pass across the slope.

Mulch applications in extremely clayey soils should be evaluated carefully to avoid developing an adobe mixture. In these cases, a soil amendment may be beneficial.

Noxious and Invasive Weed Control

Should noxious or invasive weeds be documented after earthwork and seeding activities, Hilcorp will follow SUIT and/or BLM requirements and instructions for weed treatments, including the period of

treatment, approved herbicides that may be used, required documentation to be submitted to the SUIT and/or BLM after treatment, and any other site-specific instructions that may be applicable.

III. MONITORING AND FINAL ABANDONMENT

Monitoring Plan

Monitoring will be completed according to SUIT and/or BLM requirements. Monitoring activities will be initiated after the project is completed, during the post-disturbance earthwork and seeding inspection process.

Final Abandonment

Upon final abandonment, Hilcorp will file for ROW Grant termination with the SUIT. Hilcorp would relinquish ROW Grants for the pipeline corridor. Surface disturbances within the ROW Grant areas will be returned to pre-disturbance conditions as practicable according to SUIT procedure.

Certification to Access Lands

I/We are aware that Hilcorp San Juan L.P. intends to drill, complete, produce, and eventually abandon a well into the Fruitland Coal formation (hereinafter, the "Well"). The well pad and access road leading to the Well will be located on lands owned by Robert W Austin Living Trust, Linda Austin Seykora Amended and Restated Trust, and Constance A Kuncicky Irrevocable Trust. Therefore, as requested by the Tres Rois BLM office, please consider this letter sufficient to fulfill the requirement as set forth in U.S. DOI BLM Permanent Instruction Memorandum No. 201-014 authorizing access to the Department of the Interior and its contractors to perform all necessary inspections, carry out plugging/abandonment procedures and address any unresolved liabilities pertain to the Well.

This instrument may be executed in counterparts, each of which shall be deemed an original, but all of which together constitute one and the same instrument.

IN WITNESS WHEREOF, the undersigned has caused this instrument to be executed effective as of the date set forth above.

SHEET F

Surface Use Plan of Operations for Southern Ute 703H

The following is required information concerning the possible effect, which the Southern Ute 703H project may have on the environment, existing road sites, and surrounding acreage. A copy will be posted on the derrick floor so all contractors and sub-contractors will be aware of all items on this plan.

Infrastructure proposed to be constructed, operated, subsequently interim reclaimed, and eventually fully reclaimed as part of the Southern Ute 703H project entails one (1) well pad with production facilities and construction buffer zone, one (1) access road, and one (1) gas pipeline. The proposed project would be built on both fee and tribal surface and will access fee and tribal minerals. The Southern Ute 703H well pad is on fee surface. The pipeline to take gas from the Southern Ute 703H and access road to and from the Southern Ute 703H well is on both SUIT tribal fee lands and lands owned by the Mary S. Austin Estate. The Southern Ute 703H well would be horizontally drilled, possibly produced, and eventually plugged and abandoned from the proposed well pad location. The proposed well would access Tribal minerals in lease number 14-20-151-6 and 14-20-604-4254.

Sheet J – Existing Road Improvements
Sheet K – Surface Use Letter Agreement

Appendix A – Revegetation Plan
Appendix B – Road Maintenance Plan

1) Existing Roads

- a. Existing State and County roads are shown on **Sheet B1**.
- b. Directions to the Site are provided on **Sheet C**.
- c. The existing State and County roads adjacent to the proposed well pad will be used to supply the location during operations. These existing roads are categorized as resource roads.
- d. Roads will be maintained in same or better condition as they existed prior to the commencement of operations and said maintenance will continue until final abandonment and reclamation of the well location. Maintenance would continue until final abandonment and reclamation of the well location (See **Appendix B**).
- e. Dust emissions will be controlled on the roads and location, as necessary, with the application of dust suppressants and/or water. Dust control will be implemented when dust plumes become larger than normal road use conditions or when directed by the BLM or SUIT Authorized Officer.
- f. Hilcorp has committed to upgrading a section of the access road as shown on **Sheet J**. A total of 6786' of existing roadway will be upgraded by adding 3" minus road base after twelve new culverts are installed at the locations indicated on **Sheet J**. No new topsoil will be needed to upgrade this section of road. Any soil removed from the existing roadway that is not needed during the upgrade will be incorporated into shoulder that is adjacent to and parallel with the bar-ditch.

2) New or Reconstructed Roads

- a. The resource road and well pad will be designed and constructed in accordance with the BLM Gold Book Standards and BLM 9113-1 (Roads Design Handbook) and BLM 9113-2 (Roads National Inventory and Condition Assessment Guidance and Instructions Handbook). Construction may include ditches, drainage, culverts, traffic turnouts, crowning and capping or sloping and dipping the roadbed to provide a well-constructed and safe road and well pad. **Appendix B** is the Road Maintenance Plan for new and reconstructed access roads and outlines the plan for road inspections, new road design and maintenance procedures.
- b. The proposed road to the well pad was identified as a resource road.
- c. The new resource road will be constructed per route identified on **Sheets B1, B2 and B3** of which 78.63 feet is on fee lands.
- d. Maximum width will be 30-foot overall right-of-way with a 14-foot road running surface. During drilling and subsequent operations, all equipment and vehicles will be confined to the 14-foot driving surface.

- e. There will be one 24" x 30' culvert on the new access road (**See Sheet B3**).
- f. Topsoil removal, storage, and protection are described in detail in the Surface Reclamation Plan.
- g. No construction or routine maintenance activities would be performed during periods when the soil is too wet to adequately support construction equipment. If equipment creates ruts deeper than six inches (6"), the soil would be deemed too wet for construction or maintenance.
- h. Hilcorp will be responsible for road maintenance from the beginning of construction to completion of operations and the well is plugged and abandoned. See attached Road Maintenance Plan (**Appendix B**).
- i. Dust emissions will be controlled on the roads and locations, related to Hilcorp activity, with the application of dust suppressants and/or water. Dust control will be implemented when dust plumes become larger than normal road use conditions or when directed by the BLM or SUIT Authorized Officer.
- j. The proposed resource road will not be constructed to all weather standards prior to drilling and completing the proposed well. If the well proves to require year-round traffic due to increased production, Hilcorp will schedule a meeting with the BLM and SUIT to discuss which portions of the roads (proposed resource road and existing resource roads) may require upgrades and/or surfacing to prevent soil erosion.
- k. The following Best Management Practices will be implemented:
 - i. Drainage and ditch design; will line ditches with rock around corners and slopes.
 - ii. Hilcorp has committed to upgrading a section of the access road. **See Sheet J** for details of the upgrades and a map depicting the upgraded area.

3) Location of Existing Wells

Water wells and oil and gas wells (plugged and abandoned, active, and proposed) within a 1-mile radius of the proposed Southern Ute 703H area are depicted in **Sheet D1 and D2**. There are 14 water wells and 29 oil and gas wells (plugged and abandoned, active, or proposed) within a 1-mile radius of the proposed well pad location.

- a. Adjacent producing and plugged and abandon oil and gas wells are shown on **Sheet D1**.
- b. Adjacent water wells are shown on **Sheet D2**.

4) Location of Existing and/or Proposed Production Facilities

Hilcorp elects to defer providing the BLM with the well layout of production equipment (site security diagram) per Onshore Order 1 Section VIII. Hilcorp will provide the well layout of production equipment using the Notice of Intent (NOI) once the post completion facility set onsite has been conducted with the BLM's Environmental Protection Staff. The site security diagram will be provided after the well has been completed and facilities have been set. The typical well producing into this formation has the following production facilities.

- i. Two 80 BBL Produced Water Tanks
 - ii. Separator
 - iii. Production pit
 - iv. Pumping unit
 - v. Meter House
 - vi. Compressor
- b. Harvest will be the gas transporter for this well. A 4-1/2" OD buried steel pipeline that is approx. 7287' in length of on Southern Ute Tribal Fee and 2436' on lands owned by the Mary S. Austin Estate. Harvest has applied for right-of-way with the Southern Ute Tribe for this right-of-way. Please refer to **Sheet E** for additional information on the pipeline.
- c. Any production equipment encompassed by a dirt berm or one in which fluids are present shall be adequately fenced and properly maintained in order to safeguard both livestock and wildlife.

5) Location and Types of Water Supply

- a. Water would be trucked from these sources to the proposed location (**Appendix H**).
 - i. Ignacio Water Shed - northwest 1/4 of Section 20 Township 33 North, Range 7 West, Permit Number (SJ-206)
 - ii. Self-water hole- northeast 1/4 Section 7 Township 32 North, Range 6 West, Permit Number (SD 02964 2A)
 - iii. Faverino water hole- northwest 1/4 of Section 7 Township 32 North, Range 6 West, Permit Number (SJ-17)

6) Construction Material and Methods

- a. Construction material will be obtained from the location site; any additional fill dirt that would be used during construction for the berms around production tanks and for the padding for pipe as well as the gravel to use on the berms and around production facilities will come from one of the companies listed below. The

construction material that will be brought in could be ¾-inch rock or ¾-inch road base and clean fill dirt.

- Sky Ute Sand and Gravel
 - Crossfire Aggregate Services
 - La Boca Gravel Pit
 - Permitted BLM Sandstone Pits for Road Surface Material
- b. Any trees larger than 3-inches in diameter will be cut within 12” of ground level and delimbed. Wood permits will be obtained from the SUT. Wood will be cut and hauled to the Southern Ute wood yard. Stumps will be cut as close to the ground as possible. Stumps and root balls will be hauled off or ground up and then put in the fill. Any trees smaller than 3-inches in diameter with slash and brush will be chipped, shredded or mulched and incorporated into the topsoil for later use in interim reclamation. Remaining brush will be brush-hogged or scalped at ground-level prior to ground disturbance.
- c. After removal of vegetation, topsoil will be segregated and windrowed along the edge of the resource road and stockpiled within the TUA and construction zone as indicated on **Sheets G1 and G2**. Topsoil will be defined as the top six (6) inches of soil. The stockpile topsoil will be free of brush and tree limbs, trunks and root balls, but may include chipped or mulched material so long as it is incorporated into the topsoil stockpile.
- i. Topsoil will not be stripped when soils are moisture-saturated or frozen below the stripping depth.
 - ii. Topsoil stacked and waddles will be placed around the base of the topsoil. Vehicle/equipment traffic will be prevented from crossing topsoil stockpiles.
 - iii. If the well pad becomes prone to wind or water erosion, Hilcorp will take appropriate measures to prevent topsoil loss from wind. Such measures may include using tackifiers or water to wet the topsoil stockpile so that a crust is created across the exposed soil to prevent soil loss.
- d. For well pad cut and fill see **Sheet F**.
- e. The following best Management practices will be implemented.
- i. Line ditches with rock as needed to avoid erosion.
 - ii. Topsoil will be stacked and waddles will be placed around the base of the topsoil pile.
 - iii. Use waddles as needed around fill slopes.
 - iv. Utilize a closed loop system during drilling and completion.

- v. Subsoil will be used as needed for fill material.
- f. Construction equipment may include chain saws, brush hog, scraper, maintainer, excavator, hydraulic mulcher, chipper and dozer. Construction of the resource road and well pad will take approximately 2 to 4 weeks.
- g. Construction contractors will utilize the Colorado 811 system to identify the location of any marked or unmarked pipelines or cables located in the proximity of the proposed resource road and well pad at least two working days prior to ground disturbance.
- h. All operations will be conducted in such a manner that full compliance is made with the applicable laws and regulations, the Application to Permit to Drill (APD), and applicable Notice (s) to Lessees.

Methods for Handling Waste

The Southern Ute 703H Project horizontal natural gas well will be drilled, and waste handled by the methods outlined below.

- i. Cuttings
 - i. Drilling operations would utilize a closed-loop system. Drilling of the horizontal lateral would be accomplished with water-based mud. All cuttings would be placed in roll-off bins and hauled to a commercial disposal facility or land farm. Hilcorp would follow Onshore Oil and Gas Order No. 1 regarding the placement, operation, and removal of closed-loop systems. No blow pit would be used.
 - ii. Closed-loop tanks would be adequately sized for containment of all fluids.
- j. Drilling Fluids
 - i. Drilling fluids would be stored onsite in above-ground storage tanks. Upon termination of drilling operations, the drilling fluids would be recycled and transferred to other permitted closed-loop systems or disposed of at one of the locations specified below in part G.
- k. Spills
 - i. Any spills of non-freshwater fluids would be immediately cleaned up and removed to an approved disposal site.

- l. Sewage
 - i. Portable toilets would be provided and maintained as needed during construction.
- m. Garbage and other waste material
 - i. All garbage and trash would be placed in an enclosed metal trash containment. The trash and garbage would be hauled off site and dumped in an approved landfill, as needed.
- n. Hazardous Waste
 - i. No chemicals subject to reporting under Superfund Amendments and Reauthorization Act Title III in an amount equal to or greater than 10,000 pounds would be used, produced, stored, transported, or disposed of annually in association with the drilling, testing, or completing of these wells.
 - ii. No extremely hazardous substances, as defined in 40 CFR 355, in threshold planning quantities would be used, produced, stored, transported, or disposed of annually in association with the drilling, testing, or completing of these wells.
 - iii. All fluids (i.e., scrubber cleaners) used during washing of production equipment would be properly disposed of to avoid ground contamination or hazard to livestock or wildlife.
- o. Produced Water
 - i. Hilcorp would dispose of produced water from the Southern Ute 703H Project well at the following facility:
 - 1. San Juan 32-7 Unit 301 SWD, API 30-045-28549, operated by Hilcorp Energy Company, located in the Southwest ¼ of the Southwest ¼ Section 34, Township 32 North, Range 7 West.
 - ii. Produced water would be transported via trucking. Some produced water may also be used in future drilling and completion operations as an alternative disposal method.

7) Ancillary Facilities

Any existing Hilcorp locations may be used for staging during construction, drilling, and completion operations. Standard drilling operation equipment that will be on location includes

drilling rig with associated equipment, temporary trailers equipped with sleeping quarters necessary for company personnel, toilet facilities, and trash containers.

8) Well Site Layout for Drilling and Completion

- a. The proposed drill pad layout is shown on **Sheet G1 and G2 and Sheet G3 (rig layout)**. Cross sections have been drafted to visualize the planned cuts and fill across the location – see **Sheet F**. Refer to Section 6 for construction materials and methods.
- b. Office trailers equipped with living quarters will be provided on location during drilling and completion operations.

9) Plans for Surface Restoration.

- a. During reclamation activities, Seed Mix 1 has been selected from the Southern Ute seed mixes, see **Appendix A** for detailed reclamation.
- b. See **Appendix A** for details of interim and final reclamation.

10) Other Information.

- a. Construction contractors would call Colorado One-Call (or equivalent) to identify the location of any marked or unmarked pipelines or cables located in proximity to the proposed Southern Ute 703H Project or any other areas proposed to have ground disturbance at least two working days prior to ground disturbance.
- b. The cultural survey report was submitted to the appropriate surface managing agencies. Cultural mitigation would occur if any is listed in the approved APD.
- c. All activities associated with the construction, use/operation, maintenance, and abandonment or termination of the Southern Ute 703H Project well would be limited to areas approved in the APD(s).

Well Number: 703H

Is the reclamation bond a rider under the BLM bond?

Unlined pit bond number:

Unlined pit bond amount:

Additional bond information

Section 4 -

Would you like to utilize Injection PWD options? N

Produced Water Disposal (PWD) Location:

PWD surface owner:

PWD disturbance (acres):

Injection PWD discharge volume (bbl/day):

Injection well mineral owner:

Injection well type:

Injection well number:

Injection well name:

Assigned injection well API number?

Injection well API number:

Injection well new surface disturbance (acres):

Minerals protection information:

Mineral protection

Underground Injection Control (UIC) Permit?

UIC Permit

Section 5 - Surface

Would you like to utilize Surface Discharge PWD options? N

Produced Water Disposal (PWD) Location:

PWD surface owner:

PWD disturbance (acres):

Surface discharge PWD discharge volume (bbl/day):

Surface Discharge NPDES Permit?

Surface Discharge NPDES Permit attachment:

Surface Discharge site facilities information:

Surface discharge site facilities map:

Section 6 -

Would you like to utilize Other PWD options? N

Produced Water Disposal (PWD) Location:

PWD surface owner:

PWD disturbance (acres):

Other PWD discharge volume (bbl/day):

Operator Name: HILCORP ENERGY COMPANY

Well Name: SOUTHERN UTE

Well Number: 703H

Other PWD type description:

Other PWD type

Have other regulatory requirements been met?

Other regulatory requirements

APD ID: 10400091970

Submission Date: 05/02/2023

Operator Name: HILCORP ENERGY COMPANY

Well Name: SOUTHERN UTE

Well Number: 703H

Well Type: COALBED NATURAL GAS WELL

Well Work Type: Drill
